TABLE OF CONTENTS

A.1 Scope.....	A-1
A.1.1 Identification	A-1
A.1.2 System overview	A-1
A.1.3 Document overview	A-1
A.2 Referenced documents	A-3
A.3 Conventions	A-3
A.3.1 Data elements	A-3
A.3.1.1 Binary angular measure format (BAM)	A-3
A.3.1.2 Integer formats (INTEGER)	A-4
A.3.1.2.1 Unsigned integer	A-4
A.3.1.2.2 Two's complement integer	A-4
A.3.1.3 Boolean	A-4
A.3.1.4 Coded	A-5
A.4 Initialization data.....	A-5
A.4.1 Initialization data set format	A-6
A.4.2 Initialization protocols	A-7
A.4.2.1 Phase 1 - start-up.....	A-9
A.4.2.2 Phase 2 - initialization data load	A-10
A.4.2.3 Phase 3 - initialization data validity checking	A-14
A.4.2.4 Phase 4 - initialization data changes and requests	A-14
A.4.3 TACAN standalone mode initialization protocols.....	A-19
A.4.3.1 TACAN standalone phase 1 - start-up	A-21
A.4.3.2 TACAN standalone phase 2 - initialization data load.....	A-22
A.4.3.3 TACAN standalone mode phase 3 - initialization data changes.....	A-23
A.4.3.4 Identification of operating mode.....	A-24
A.4.3.5 Transition from TACAN standalone mode to run mode	A-25
A.4.4 Initialization data set content	A-30
A.4.4.1 Radio frequency (RF) mode (word #1).....	A-168
A.4.4.2 Primary source track number (word #2)	A-172
A.4.4.3 Terminal function word 1 (word #3).....	A-172
A.4.4.4 Terminal function word 2 (word #4).....	A-176
A.4.4.5 Terminal function word 3 (word #5).....	A-180

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

A.4.4.6 Station latitude (words #6-7).....	A-181
A.4.4.7 Station longitude (words #8-9)	A-181
A.4.4.8 Station position antenna height (word #10)	A-182
A.4.4.9 Position/height uncertainty (word #11).....	A-182
A.4.4.10 Reserved.....	A-186
A.4.4.11 Default net number (word #17).....	A-186
A.4.4.12 Default cryptovvariable logical labels (word #18)	A-186
A.4.4.13 Reserved (words #19-22)	A-187
A.4.4.14 Digital voice words (word #23-24).....	A-187
A.4.4.15 ETR cable delay (word #25)	A-189
A.4.4.16 Cable delay antenna A/B (word #26-29)	A-190
A.4.4.17 Initialization set word (word #30).....	A-191
A.4.4.18 Secondary source track number words 1-16 (words #31-46)	A-192
A.4.4.19 Repromulgation word (word #47).....	A-193
A.4.4.20 Platform indicator word (word #48)	A-195
A.4.4.21 Platform identifier (ID) (word #49)	A-198
A.4.4.22 Mission information words 1-4 (words #50-53)	A-199
A.4.4.23 EMC features parameters (word #54).....	A-202
A.4.4.24 Reserved for terminal use (word 57).....	A-204
A.4.4.25 Navigation system type (word #58)	A-204
A.4.4.26 Initial entry message assignment inhibit (word #59)	A-208
A.4.4.27 Reserved.....	A-210
A.4.4.28 Time slot assignment blocks #1-64 (words #61-444).....	A-210
A.4.4.28.1 Non-relay time slot assignment block.....	A-211
A.4.4.28.2 Relay time slot assignment block.....	A-221
A.4.4.29 Time slot reallocation pools #0-7 (words #447-478).....	A-231
A.4.4.30 Voice group A variable control word (word #481).....	A-238
A.4.4.31 Voice group B variable control word (word #482).....	A-239
A.4.4.32 Control channel variable control word (word #483).....	A-240
A.4.4.33 Cryptovvariable logical label definition words 1-96 (words #484-579).....	A-241
A.4.4.34 Initial entry words 1-10 (words #580-589)	A-243
A.4.4.35 Recording function words (words #590-642)	A-244
A.4.4.35.1 Recorder function words 1-8 (words #590-600).....	A-245
A.4.4.35.1.1 Reserved (words #596-600)	A-246
A.4.4.35.2 Status data recording selection words 1-2 (words #601-604).....	A-246

LINK-16/TACAN WAVEFORM ICD (SW ICD) - VOLUME I OF III

A.1 Scope

A.1.1 Identification

This document establishes the Software Interface Control Document (ICD), also referred to as the Software Interface Control Specification (ICS), for the Multifunctional Information Distribution System Joint Tactical Radio System (MIDS-JTRS). For the purposes of this document, the expression "Terminal" refers to a Receiver-Transmitter (RT) (Type Designation: RT-1925(C)/U) Line Replaceable Unit (LRU) and Power Supply, henceforth referred to as the Remote Power Supply (RPS LRU) (Type Designation: PP-8559/U). This Appendix is a mandatory part of the specification. The information contained herein is intended for compliance.

A.1.2 System overview

a. System Overview:

The MIDS-JTRS is an advanced information distribution system that integrates communication, navigation and identification capabilities for application to airborne, land-based, and maritime tactical operations.

b. ICS Overview:

This Software ICS defines completely for all Platforms hosting the MIDS-JTRS Terminal:

1. the Terminal initialization data and associated protocols to load, modify or request these data
2. the Terminal Status data and associated protocols to request these data
3. the functional messages exchanged between the Terminal and the Platforms
4. the Bus messages exchanged between the Terminal and the Platforms and associated Bus protocols and exchange rates
5. the format, units and range of all message data elements

In this document, the MIDS-JTRS Terminal will be referred to as the Terminal. The Platform or the Host will refer to any of the platforms hosting the Terminal. When no specific platform name is referenced, the following ICS applies to all platforms. The Platform will be explicitly referenced only when something does not apply to every Platform.

A.1.3 Document overview

The document is organized as follows:

- a. Section A.2, REFERENCED DOCUMENTS, gives the list of the documents referenced.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

- b. Section A.3, CONVENTIONS, defines the types and formats used to represent all data elements described throughout this software ICS.
- c. Section A.4, INITIALIZATION DATA, defines:
 - 1. the Initialization Data File format,
 - 2. the initialization protocols for initialization data load at Terminal start-up, initialization data changes, and initialization data requests and reporting,
 - 3. and the Initialization Data File content.
- d. Section A.5, STATUS DATA, defines the Status Data File content as well as associated protocols to request and report these data.
- e. Section A.6, FIM/FOM/BIM/BOM APPROACH AND GUIDELINES, defines the approach used in this ICD to achieve a unified ICD with as few differences as possible from one Platform to another.

For this, a layered approach has been used. At first, the messages are described as Functional Input & Output Messages (FIMs & FOMs, section A.7). FIMs & FOMs represent the information exchange at the Terminal capability level (Bus protocols and Bus level message formats are not considered). At a Host Data Bus level, FIMs and FOMs are mapped to Bus Input & Output Messages (BIMs & BOMs, PLATFORM TYPE x sections).

- f. Section A.7, FUNCTIONAL MESSAGES, defines all the Functional Input & Output Messages exchanged between the Platforms and the Terminal, and a description of the Special Radio messages.
- g. Section A.8, SUPPORT PORT, defines the support port Bus protocol and messages.
- h. Section A.9, PLATFORM TYPE A, defines Platform type A data Bus protocol and messages.
- i. Section A.10 Reserved (PLATFORM TYPE B).
- j. Section A.11 Reserved (PLATFORM TYPE C).
- k. Section A.12 Reserved (PLATFORM TYPE D).
- l. Section A.13 Reserved (PLATFORM TYPE E).
- m. Section A.14 Reserved (PLATFORM TYPE F).
- n. Section A.15 Reserved (PLATFORM TYPE G).
- o. Section A.16, PLATFORM TYPE M, (Reserved for United States Navy - MIDS On Ship (MOS)).
- p. Section A.17, PLATFORM TYPE I, defines Platform type I data Bus protocol and messages.
- q. Section A.18, PLATFORM TYPE N, defines Platform type N data Bus protocol and messages.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

- r. Section A.19, PLATFORM TYPE L, defines Platform type L data Bus protocol and messages.
- s. Section A.20 Reserved (PLATFORM TYPE O).
- t. Section A.21 Reserved (PLATFORM TYPE P).
- u. Section A.22, Acronyms, gives the list of the acronyms used throughout this document.

A.2 Referenced documents

The applicable documents are listed in RL-JC-10001, Reference List (RL) Functional Baseline (FBL) Specifications and Interface Documents for the Multifunctional Information Distribution System Joint Tactical Radio System (MIDS JTRS).

A.3 Conventions

A.3.1 Data elements

This section defines all data types used in this document. Any reference throughout this document to one of the following data types shall use the corresponding format described. The scale for all variables and associated physical quantities represented in this document shall be 1 unless otherwise stated. The most significant bit (MSB) will always be on the left and the least significant bit (LSB) on the right unless otherwise indicated.

A.3.1.1 Binary angular measure format (BAM)

BAM is a method by which angles are represented as fixed point binary numbers scaled so that the most significant bit, bit n-1, has value of -180 degrees. The scaling on n-bit binary is as follows (bit 0 is the LSB):

<u>Bit</u>	<u>Value</u>
n-1 (MSB)	-180
n-2	$90 = 180/(2^{n-((n-2)+1)})$
n-3	$45 = 180/(2^{n-((n-3)+1)})$
...	...
1	$180/(2^{n-2})$
0 (LSB)	$180/(2^{n-1})$

BAM measure can be given in radians as well as degrees. In this case the MSB has value π and the scaling on n-bit binary is as follows:

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

<u>Bit</u>	<u>Value</u>
n-1 (MSB)	$-\pi$
n-2	$\pi/2 = 180/(2^{n-((n-2)+1)})$
n-3	$\pi/4 = 180/(2^{n-((n-3)+1)})$
...	...
1	$\pi/(2^{(n-2)})$
0 (LSB)	$\pi/(2^{(n-1)})$

A.3.1.2 Integer formats (INTEGER)

There are two different integer formats: unsigned and two's complement.

A.3.1.2.1 Unsigned integer

Unless otherwise stated, all INTEGER fields are coded in this format. The scaling of an n-bit binary number is as follows (bit 0 is the LSB):

<u>Bit</u>	<u>Value</u>
n-1 (MSB)	$2^{(n-1)}$
n-2	$2^{(n-2)}$
n-3	$2^{(n-3)}$
...	...
2	4
1	2
0 (LSB)	1

This format gives an n-bit field a range of all integers greater than or equal to zero but less than 2^n .

A.3.1.2.2 Two's complement integer

The MSB of a two's complement integer is the sign bit, the LSBs are the magnitude. If the sign bit is zero the magnitude is determined as an unsigned integer and is a positive quantity. If the sign bit is one, the magnitude is one's complemented, then incremented by one. The magnitude is then a negative quantity.

A.3.1.3 Boolean

If the interpretation of this one-bit field is not specified, the convention to be followed in this document shall be to assume that logic 1 is the affirmative or positive state and logic 0 is the negative state. Otherwise, both logic states will be explicitly called out.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

A.3.1.4 Coded

This format is used to represent non-numerical information. The value of this field is always represented as an unsigned integer and the corresponding meaning is provided explicitly.

A.4 Initialization data

The initialization data file contains the adaptable parameters (APs) the Terminal is required to accept from the Host and use for control of its operations. Adaptable parameters are values which can be adjusted at Terminal start-up or by host or network changes during Terminal operation.

- a. The following definitions will be used throughout this section:
 1. Current Use Set is the initialization data set which has passed validity checking and with which the Terminal is operating.
 2. Stored Set is an initialization data set, other than the Current Use Set, which has passed validity checking and which is stored in the File System.
 3. Pending Set is an initialization data set which is not the Current Use Set and which is not a Stored Set. A pending set is located in local Random Access Memory (RAM).
- b. General requirements:
 1. The Current Use Set is maintained and stored in the File System for Terminal recovery after power interrupt. However, there are several adaptable parameters whose settings are not stored in the File System because they are control words used only to initiate action in the Terminal or because they are validity indicators associated with fields which are valid only upon input to the Terminal. A list of these parameters is provided in TABLE A-LXXIV.[SS/ICS App A V1 776]
 2. In addition to the Current Use Set, the Terminal is required to accept, store, and maintain up to eight sets of initialization data denoted as "Stored Sets." Each Stored Set is identified by a SET INDEX NUMBER (AP364).
 - a) Among those eight sets, one or none may be set to active by the Host (SET ACTIVITY INDICATOR-SAI, AP363). The Stored Set (if any) with the active SAI is to be denoted as the "Active Stored Set."
 - b) If one of the Stored Sets is set to active by the Host, the Terminal shall copy the Active Stored Set into the Current Use Set and it shall be used for control of its operations. In that case, the CURRENT SET INDEX NUMBER (Status word 931) shall be equal to the set index number of the Active Stored Set. It will be 0 otherwise. The Terminal shall maintain the Active Stored Set and other Stored Sets independently of the Current Use Set. In particular, the initialization data changes to be applied on the Current Use Set shall not be applied to the Active Stored Set it is derived from.[SS/ICS App A V1 779]

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

The following sections define in detail the initialization data set format and content as well as the protocols for initialization data load at Terminal start-up, initialization data changes, and initialization data requests and reporting.

A.4.1 Initialization data set format

As depicted in FIGURE A-1, the Initialization Data required by the Terminal are organized in initialization data sets. Each set consists of 16-bit words numbered sequentially from 1 to 5910.

All the 16-bit words of each initialization data set will be stored in the Terminal's File System. This enables the Terminal to retain the Current Use Set after a loss of primary power or after being in Standby mode of operation. A copy of the Current Use Set in local memory serves as an intermediate storage point between the Host and the master copy in the File System.

The initialization data words contained in the initialization data file are presented in A.4.3.

FIGURE A-1. Initialization data file format

A.4.2 Initialization protocols

The Terminal shall begin its initialization processing after the Link 16 Waveform has been instantiated and started. Four phases of initialization processing in the Terminal can be identified:

a. Phase 1 - Terminal Start-Up

The Terminal inspects current initialization data and determines whether or not Host input of initialization data is required.

b. Phase 2 - Initialization Data Load

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

The Terminal allows the Host to input initialization data segments, a segment being a sequence of contiguous 16-bit words of the initialization data file. The Host may input initialization data segments for the Current Use Set and/or any of up to 8 Stored Sets.

c. Phase 3 - Initialization Data Validity Checking

The Terminal checks the validity of the Current Use Set or of an Active Stored Set following the completion of an Initialization Data Load.

d. Phase 4 - Initialization Data Changes and Requests

The Terminal allows the Host to change initialization data in the Current Use Set or in Stored Sets and to request initialization data from the Current Use Set or from Stored Sets. The Terminal allows the Host to load additional Stored Sets and to delete existing Stored Sets. The Terminal notifies the Host of changes made in the current use initialization data set from sources other than the Host (FOM06, Init Data Change Notification FOM). The Terminal reports to the Host all changes made in the Current Use Set from the Host itself or from sources other than the Host (FOM27, Initialization Data Update FOM).

FIGURE A-2 is a state-transition diagram that describes the overall processing of initialization data. The bubbles represent the phases (or states) and the arrows represent the transitions. The transitions are identified by a number, between brackets, followed by text describing the event that triggers the transition (e.g. [1] Load Complete Valid Data).

The phases are described in more detail in the following sections. Note that references within the subsections of A.4.2 to these four phases pertain to the phases defined in A.4.2 and not A.4.3.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

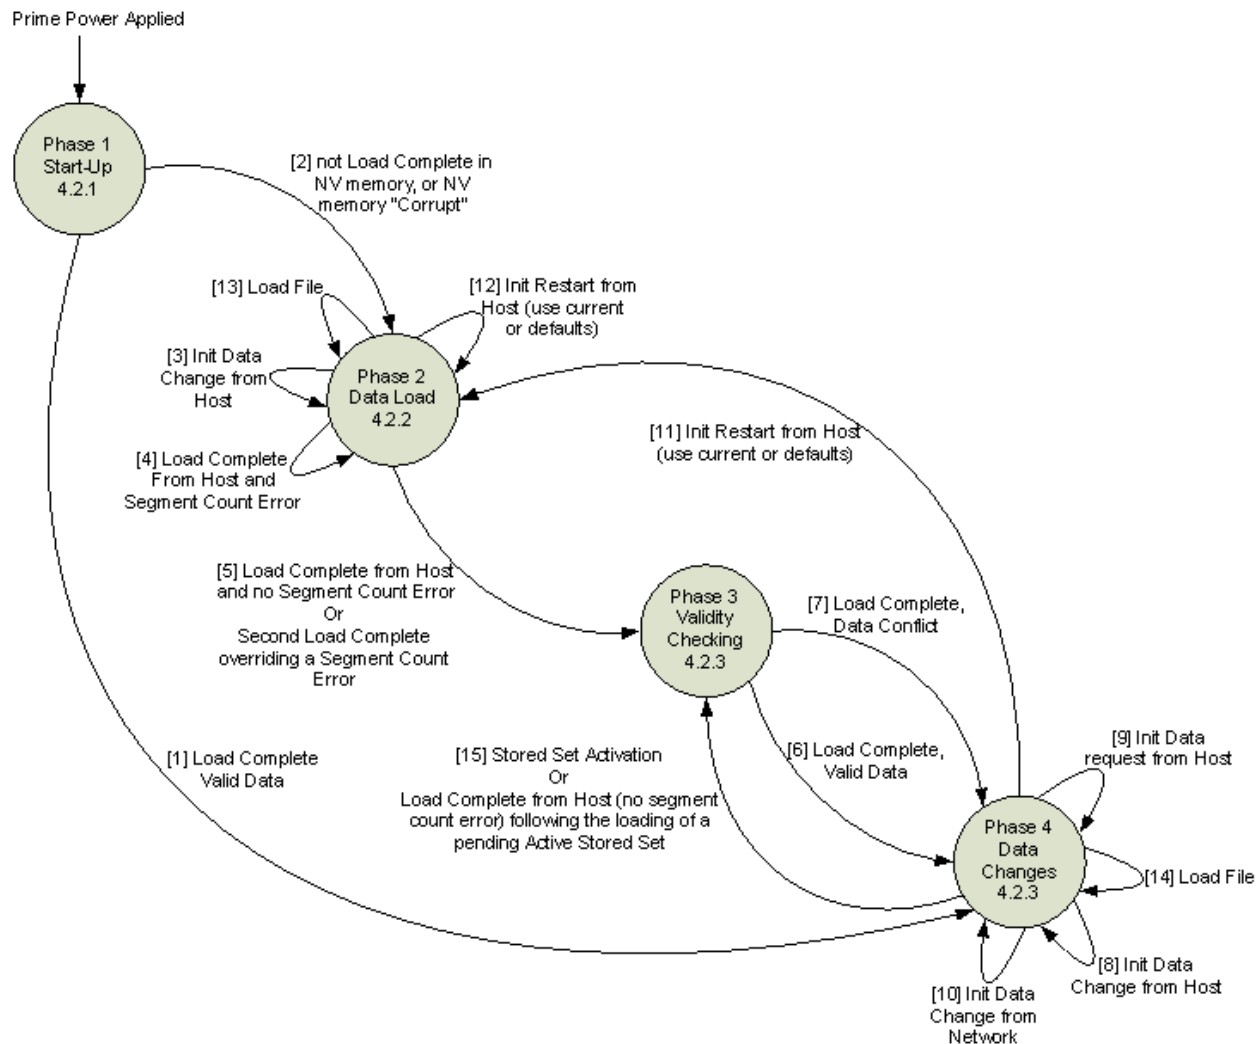

FIGURE A-2. Initialization protocol

A.4.2.1 Phase 1 - start-up

This phase is performed whenever prime power is applied to the Terminal after the Link 16 Waveform has been instantiated (See FIGURE A-2, Phase 1). The purpose of this phase is to determine the integrity of the Link 16 Waveform's Current Use Set stored in the File System and to determine whether it can start using those data or if the Host has to provide new data. During this phase, the Link 16 Waveform will ignore all Host inputs and in particular all Init Data Change FIMs.

The Link 16 Waveform clears the Initialization Data Load Status (Status Words 931 to 939, Status Words 961 to 998, Status Words 1000 to 1019, Status Words 1021 to 1058 and Status Words 1060 to 1079), used to provide to the Host the results of the Validity Checking Phase, Phase 3, on initialization data segments.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

The Link 16 Waveform computes the Boolean checksums of the Current Use Set stored in the File System. If the Link 16 Waveform computed checksum matches the checksum stored by the Link 16 Waveform in the copy stored in the File System, the Current Use Set will be validity checked; otherwise, the copy of the Current Use Set in the File System will be declared "Corrupt." If it passes validity checking, the copy of the Current Use Set will be declared "Not Corrupt"; otherwise, the copy of the Current Use Set in the File System will be declared "Corrupt."

The Link 16 Waveform will proceed in one of three ways based on the above criteria:[SS/ICS App A V1 893]

- a. If the Current Use Set in the File System is "Not Corrupt,"[SS/ICS App A V1 894]
 1. If the startup type is cold, that is the Terminal has transitioned to the operational state from the OFF mode (OFF/standby, the Internal Power Supply (IPS) needs to provide this to the Operating Environment (OE)), the Link 16 Waveform shall load all default initialization data into local memory, send the Ongoing Built-In-Test (BIT) & Status FOM (Ongoing BIT & Status FOM) with the CURRENT INITIALIZATION STATE field set to "Awaiting Load," and proceed to Phase 2.
 2. Else the Link 16 Waveform shall load the current use initialization data set from the File System into local memory, send the Ongoing BIT & Status FOM (see A.7.2.3 of Volume II) with the CURRENT INITIALIZATION STATE field set to "Load Complete, Valid Data," and proceed to Phase 4.
- b. If the Current Use Set in the File System is "Corrupt," the Link 16 Waveform shall load all default initialization data into local memory, send the Ongoing BIT & Status FOM with the CURRENT INITIALIZATION STATE field set to "Awaiting Load," and proceed to Phase 2.[SS/ICS App A V1 895]

The Link 16 Waveform shall perform a checksum check on the Stored Sets. If the Stored Set checksum is valid, the Link 16 Waveform shall set the Load Status corresponding to the Stored Set (Status words 931-939) to "Validity check complete-Valid data." If the stored checksum is not valid, the Link 16 Waveform shall delete the Stored Set and will set the Load Status corresponding to the Stored Set (Status words 931-939) to "No statement-corresponding set not loaded." [SS/ICS App A V1 897]

When this phase terminates with a.2 above, the Link 16 Waveform has a Current Use Set and shall proceed to Phase 4.[SS/ICS App A V1 898]

When this phase terminates with a.1 or b., the Link 16 Waveform does not have a Current Use Set and shall proceed to Phase 2.

A.4.2.2 Phase 2 - initialization data load

This phase is performed after Phase 1 or Phase 4. During this phase, the Link 16 Waveform allows the Host to input initialization data segments, complete the load, or restart the load. The network operation is suspended while the Link 16 Waveform is in this phase, because there is no

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Current Use Set to operate with. During this phase, initialization data changes via FIM03 are queued by the Link 16 Waveform. These changes are not processed until a Load Complete command (see Load Complete Processing section) has been received. If either FIM27 or FIM28 are received during this phase, they will be rejected.[SS/ICS App A V1 902]

a. Initialization data loading:

1. Initialization data loading should begin with the Current Use Set as specified in the part b. "Initialization data set loading" below, if it is intended to load a Current Use Set directly. If a pending Active Stored Set (defined as a Stored Set that is in the course of becoming the Current Use Set by the process defined in A.4.2.4) is loaded during this phase, that set shall supersede any data entered directly in the Current Use Set, including adaptable parameters that would normally be retained from the Current Use Set in Phase 4 (refer to Stored Set activation and loading of a pending Active Stored Set, both in A.4.2.4, Phase 4). [SS/ICS App A V1 904]
2. If active or inactive Stored Set data is to be loaded, the Host shall provide a Load File N Command (i.e., an Initialization Data Change FIM for which the LOAD COMMAND field indicates "Load File," and the SET INDEX NUMBER field is N).
3. If a Load File N Command is received and there is a Stored Set with index N in the File System, the Stored Set in the File System will be deleted. If a Load File N Command is received and there is a pending Stored Set with index N in local memory, the pending Stored Set in local memory will be deleted. If a Load file N Command is received and there is no stored or pending Stored Set with index N, and there are already eight pending or Stored Sets, the Load File Command will be ignored. If a Load File N Command is received, the Link 16 Waveform will establish a pending Stored Set N in local memory. When a pending Stored Set N is established, the Link 16 Waveform shall clear the Stored Set Number (1021) and Stored Set Initialization Status (Status Words 1022-1058 and Status Words 1060-1079) which will thereafter apply to set N, whether pending or stored in the File System, until another Load File Command is received or an Initialization Restart is issued. A pending Stored Set will not be stored in the File System until the Host provides a Load Complete Command and the pending Stored Set has been validity checked. Initialization changes received subsequently to a Load File N Command which do not include a set index N or a set index 0 will be ignored until a Load File Command is received for a different set, a Load Complete Command is received, or an Initialization Restart is issued. The Link 16 Waveform will remain in Phase 2 to accept further initialization data changes. Initialization changes with set index 0 will be made to the Current Use Set. Initialization changes which include set index N will be made to the pending set N. Loading of each individual data set is as specified in the part b. "Initialization data set loading" below.[SS/ICS App A V1 906]

b. Initialization data set loading:

1. The Link 16 Waveform shall accept any number of Init Data Change FIM03s for which the LOAD COMMAND field indicates "Initialization Data Change." The

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

- FIM03's field REQUEST NUMBER will be ignored by the Link 16 Waveform and no Initialization Data Change acknowledgement FOM05 will be sent to the Host. The initialization data segments, each contained in an Initialization Data Change FIM03, may be sent in any order and may be repeated by the Host. The Link 16 Waveform will maintain a count of the total number of segments entered, regardless of which sets they apply to, including in the count any repeated segments, but not including any which were ignored, as described in a.[SS/ICS App A V1 908]
2. When the Link 16 Waveform is in Phase 2 (Awaiting Load), after receiving the first initialization data segment intended for the Current Use set or any pending stored set, the Link 16 Waveform will send the Ongoing BIT & Status FOM (see A.7.2.3 of Volume II) with the CURRENT INITIALIZATION STATE field set to "Load In Progress" and remain in Phase 2. Once the CURRENT INITIALIZATION STATE has transitioned to 'Load in Progress,' for the remainder of Phase 2 and throughout Phases 3 and 4, only changes to the status of the Current Use Set shall be reflected by changes to the CURRENT INITIALIZATION STATE field.[SS/ICS App A V1 909]
- c. Initialization Data Load termination:
- Host input of initialization segments should be terminated by an Init Data Change FIM for which the LOAD COMMAND field indicates "Load Complete," and the TRANSFERRED SEGMENT COUNT field indicates the total number of segments sent for all initialization data sets loaded, including repeated segments. Upon reception of this FIM, the Link 16 Waveform will check the TRANSFERRED SEGMENT COUNT provided by the Host against the Link 16 Waveform's segment count:
1. If TRANSFERRED SEGMENT COUNT equals the Link 16 Waveform's segment count, then if there is more than one pending Stored Set marked active, all of them will be rejected except the first one that was established. If the Host has loaded an initialization data set specified as active, the Link 16 Waveform will replace the Current Use Set in local memory with the set specified as active, including adaptable parameters that would normally be retained from the Current Use Set in Phase 4 (refer to Stored Set activation and loading of a pending Active Stored Set, both in Sec. A.4.2.4, Phase 4). The Link 16 Waveform shall indicate the CURRENT SET INDEX NUMBER of the Current Use Set in Status Word#931 and in Status Word#961. Then, the Link 16 Waveform shall send the Ongoing BIT & Status FOM with the CURRENT INITIALIZATION STATE field set to "Load Complete, Validity Test In Progress" and proceed to Phase 3 (transition [5] in FIGURE A-2).[SS/ICS App A V1 912]
 2. If the TRANSFERRED SEGMENT COUNT differs from the Link 16 Waveform's segment count, then the Link 16 Waveform shall send the Ongoing BIT & Status FOM with the CURRENT INITIALIZATION STATE field set to "Load Complete, Segment Count Error" and stay in Phase 2 waiting for Host actions.[SS/ICS App A V1 913]

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

As actions,

- a) The Host may send additional initialization data changes. They shall be processed by the Link 16 Waveform and the Link 16 Waveform's segment count will be incremented (note, that the Link 16 Waveform's segment count is not reset to zero) until the host sends a Load Complete command.[SS/ICS App A V1 915]
- b) The Host may force the Link 16 Waveform to proceed to Phase 3 by resending an Init Data Change FIM for which the LOAD COMMAND field indicates "Load Complete," and the TRANSFERRED SEGMENT COUNT field indicates 0 or is equal to the Link 16 Waveform's segment count. In this case, the Link 16 Waveform shall send the Ongoing BIT & Status FOM with the CURRENT INITIALIZATION STATE field set to "Load Complete, Validity Test In Progress" and proceed to Phase 3.[SS/ICS App A V1 916]
- c) The Host may restart a complete load by sending an Init Data Change FIM for which the LOAD COMMAND field indicates "Restart Load Using Current Data" or "Restart Load Using Defaults." The Link 16 Waveform shall proceed as specified in d) below.[SS/ICS App A V1 917]
- d. Initialization Data Load restarts:

When the Host issues a "Restart Load Using Current Data" or a "Restart Load Using Defaults," either while the Link 16 Waveform is in this Phase 2 or Phase 4, the Link 16 Waveform shall:[SS/ICS App A V1 919]

- 1. clear all pending Stored Sets[SS/ICS App A V1 920]
- 2. clear the activity indicator for all Stored Sets in the File System[SS/ICS App A V1 921]
- 3. clear the Initialization Data Load Status (Status Words #931-939, #961-998, #1000-1019, #1021-1058 and #1060-1079),[SS/ICS App A V1 922]
- 4. clear its segment count,[SS/ICS App A V1 923]
- 5. load all default initialization data into local memory, in the case of a "Restart Load Using Defaults," and uses those values as initial values to process subsequent host inputs,[SS/ICS App A V1 924]
- 6. load all default initialization data into local memory, in the case of a "Restart Load Using Current Data" when the CURRENT INITIALIZATION STATE is "Awaiting Load," "Load in Progress," or "Load Complete, Segment Count Error," and uses those values as initial values to process subsequent host inputs. In that case, default data are used because there is no Current Use Set.[SS/ICS App A V1 925]
- 7. use the local copy of the Current Use set, in the case of a "Restart Load Using Current Data" when the CURRENT INITIALIZATION STATE is "Load Complete, Valid Data" or "Load Complete, Data Conflict," and uses those values as initial values to process host subsequent inputs.[SS/ICS App A V1 926]

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

8. send the Ongoing BIT & Status FOM with the CURRENT INITIALIZATION STATE field set to "Awaiting Load," and then[SS/ICS App A V1 927]
9. remain in Phase 2 to allow the Host to re-enter initialization data as specified in a. and b. above, and/or complete the load as specified in c. above.[SS/ICS App A V1 928]

A.4.2.3 Phase 3 - initialization data validity checking

This phase is performed after Phase 2. The purpose of this phase is to validity check the Current Use Set contained in the Link 16 Waveform's local memory. (Note that the Current Use Set may have been loaded as an Active Stored Set; it is not necessary to load the Current Use Set directly.)

The Link 16 Waveform shall perform validity checking of the Current Use Set contained in its local memory. The Link 16 Waveform shall replace, in local memory, the initialization data that failed validity checking with the default values and recompute the checksum. Only the rejected fields are replaced by default values. When the validity checking is complete, the Link 16 Waveform shall copy the initialization data file from local memory to the File System.[SS/ICS App A V1 936]

Validity checking of any pending stored initialization data sets will be performed by the Link 16 Waveform after the CURRENT INITIALIZATION STATE has transitioned to "Load Complete, Valid Data" or "Load Complete, Data Conflict." The status of this validity checking shall be reported by the Link 16 Waveform in the Ongoing BIT & Status FOM (FOM03) and in Status Words 932-939, and in Status Words 1022-1058, 1060-1079 for the most recently established Stored Set.

The validity of the Current Use Set words shall be indicated in Status Words #962-998 and #1000-1019. The Host may request those words by sending the Init. & Status Data Request FIM (see A.7.1.2 of Volume II) to determine the Initialization Data segment(s) which contained the invalid data.[SS/ICS App A V1 937]

If any of the initialization data failed validity checking, the Link 16 Waveform shall indicate a Bad Load to the Host by sending the Ongoing BIT & Status FOM with the CURRENT INITIALIZATION STATE field set to "Load Complete, Data Conflict" and proceed to Phase 4.[SS/ICS App A V1 938]

If a Bad Load has not been indicated, the Link 16 Waveform shall send the Ongoing BIT & Status FOM with the CURRENT INITIALIZATION STATE field set to "Load Complete, Valid Data" and proceed to Phase 4.[SS/ICS App A V1 939]

A.4.2.4 Phase 4 - initialization data changes and requests

Within this phase, The Link 16 Waveform has a Current Use Set to operate with and shall accept all Host inputs.[SS/ICS App A V1 941]

The purpose of this phase is to allow the Host to change initialization data in the Current Use Set (See FIM03, FIM27 and FIM28 depending on the Platform FIMs/FOMs usage) or in Stored Sets

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

(See FIM03), to request initialization data from either the Current Use Set or Stored Sets, to restart the initialization data load, to delete Stored Sets or to load additional Stored Sets. Also, the Link 16 Waveform has the capability to notify the Host of changes made in the Current Use Set from sources other than the Host (See FOM06) or to report to the Host all changes made in the Current Use Set by the Host itself or by sources other than the Host (See FOM27, FOM25 and FOM26 depending on the Platform FIMs/FOMs usage) or to report to the Host the acceptance of an initialization data change performed on the Current Use Set (See FOM05).

At any time (in particular in the case of a Bad Load in Phase 3), the Host may restart the load by sending an Initialization Data Change FIM for which the LOAD COMMAND field indicates "Restart Load Using Current Data" or "Restart Load Using Defaults." The Link 16 Waveform shall proceed to Phase 2.[SS/ICS App A V1 943]

In the case of a Bad Load in Phase 3, the Host may override a Bad Load with a Start Net Entry command (initialization data change of AP353 START NET ENTRY or AP321 NET ENTRY RESET) or with a valid initialization data change or with a Load Complete command with a segment count equal to 0. The Link 16 Waveform shall send the Ongoing BIT & Status FOM with the CURRENT INITIALIZATION STATE field set to "Load Complete, Valid Data," and continue with Phase 4.[SS/ICS App A V1 944]

The Link 16 Waveform shall accept Init Data Change FIM03s for which the LOAD COMMAND field indicates "Initialization Data Change" (see A.7.1.3 of Volume II). This will enable the Host to change the initialization data of the Current Use Set (FIM03 provided with no set index number), or of Stored Sets (FIM03 provided with a set index number). The Link 16 Waveform will process one Initialization Data Change FIM03 at a time in the order received, including validity checking.[SS/ICS App A V1 945]

Any initialization change with no set index number will be validity checked against the Current Use Set. If the change is valid, the data change will be made to the Current Use Set, the checksum will be recomputed, and the data will be copied to the File System, the Link 16 Waveform will send to the host the Ongoing BIT & Status FOM03 with the CURRENT INITIALIZATION STATE field set to "Load Complete, Valid Data" and the corresponding bits in the status file words #962-998 and words #1000-1019 will be cleared. If the change is not valid, the changes related to the Adaptable Parameters that passed validity checking will be made to the Current Use Set and the Current Use Set's previously held values will be retained for the Adaptable Parameters that did not pass validity checking. The Link 16 Waveform will send to the host the Ongoing BIT & Status FOM03 with the CURRENT INITIALIZATION STATE field set to "Load Complete, Data Conflict." In case of Init Data Change on the Current Use Set, Ongoing BIT & Status FOM03 shall report "Load Complete, Valid Data" after 10 seconds if "Load Complete, Data Conflict" has been reported. If the rejected data was host provided, the bits in the status words #962-998 and #1000-1019 will be set accordingly. With every valid data change, the corresponding bits in the status file words #962-998 and #1000-1019 will be cleared. During validity checking of an Initialization data change, the Link 16 Waveform does not report

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

to the Host FOM03 with the CURRENT INITIALIZATION STATE or the INITIALIZATION SETS STATUS set to "..., validity check in progress." [SS/ICS App A V1 946]

If a Load File N command is received in Phase 4, the Link 16 Waveform shall delete any Stored Set with set index N and shall establish a new pending Stored Set N, provided that the total number of pending Stored Sets plus the File System Stored Sets will not exceed 8. The Link 16 Waveform shall remain in Phase 4 to accept further initialization changes. [SS/ICS App A V1 947]

If the Link 16 Waveform has received a Load File N Command and the Link 16 Waveform is in Phase 4, the Link 16 Waveform shall only accept initialization data changes to the Current Use Set (set index not present in FIM03) or to the pending Stored Set N (i.e., changes with set index N). This condition shall continue until the Link 16 Waveform receives a restart, a load complete, or a Load File command for a different set index number. The Link 16 Waveform shall retain a count of the total number of change segments applying to pending Stored Sets.

If no Load File N command has been received (i.e., there is no pending Stored Set), the Link 16 Waveform shall accept initialization changes to the Current Use Set (set index not present in FIM03) or to Stored Sets in the File System (i.e., FIM03 having a set index matching that of a File System Stored Set). An initialization data change to a Stored Set N will be ignored if there is no Stored Set with the SET INDEX equal to N in the Link 16 Waveform. [SS/ICS App A V1 949]

The Link 16 Waveform shall validity check an initialization change to a Stored Set in the File System. If the change is valid, the Link 16 Waveform shall replace the data in the Stored Set and update the checksum, the Link 16 Waveform shall send to the host the Ongoing BIT & Status FOM03 with the INITIALIZATION SETS STATUS field set to "Set Validity Test Complete-Valid Data." If the change is not valid, the changes related to the Adaptable Parameters that passed validity checking shall be made to the Stored Set and the Stored Set's previously held values shall be retained for the Adaptable Parameters that did not pass validity checking, the Link 16 Waveform shall send to the host the Ongoing BIT & Status FOM03 with the INITIALIZATION SETS STATUS field set to "Set Validity Test Complete- Data Conflict or Set Rejected." [SS/ICS App A V1 950]

The Host may perform a "set switch" via initialization data change. An initialization data change which sets to active a Stored Set N (AP363 = Set active and AP364 = N) shall be ignored if there is already in the Link 16 Waveform a Stored Set with the SET ACTIVITY INDICATOR (AP363) set to "active." In the case there is an Active Stored Set, the Host may perform a "set switch" by sending to the Link 16 Waveform an initialization data change setting to "inactive" the Active Stored Set N (AP363 = Set not active and AP364 = N) followed by an initialization data change setting to "active" the Stored Set M (AP363 = Set active and AP364 = M). In the case there is no Active Stored Set, the host may perform a "set switch" by sending to the Link 16 Waveform an initialization data change setting to "active" a Stored Set. [SS/ICS App A V1 951]

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

During the activation of Stored Set N, certain adaptable parameters will be retained from the old Current Use Set for use in the new Current Use Set. These adaptable parameters are as follows: Start Net Entry (AP353), Thermal Override (AP354) & Date Words 1-2 (AP305, AP306, AP307, AP308, AP309). Upon activation of Stored Set N, the Link 16 Waveform shall replace the Current Use Set with Stored Set N (except for retained adaptable parameters). The Link 16 Waveform will subsequently send the Ongoing BIT and Status FOM with CURRENT INIT STATE set to "Load Complete, Validity Test in Progress" and proceed to Phase 3 for validity checking. Once validity checking of the new Current Use Set has been completed, the Link 16 Waveform will compute the checksum and store it in the File System. In the case where validity checking of the new Current Use Set final report indicates that the status of the CURRENT INITIALIZATION STATE is 'Load Complete, Valid Data,' the FOM couple, FOM25/26, which is fully representative of the adaptable parameters loaded in the new Current Use Set, shall be transmitted to the host within 160 ms after the final FOM03 with 'Load Complete, Valid Data' has been sent to the host.[SS/ICS App A V1 952]

If a Load Complete is received in Phase 4, the Link 16 Waveform shall check the Transferred Segment Count provided by the Host against the Link 16 Waveform's Segment Count.[SS/ICS App A V1 953]

If the Transferred Segment Count equals the Link 16 Waveform Segment count, then the Link 16 Waveform shall determine whether any of the pending Stored Sets are marked active. If none are marked active, the Link 16 Waveform shall proceed to validity check the pending Stored Sets. If any pending sets are marked active, and there is already an Active Stored Set, the pending Active Stored Sets shall all be rejected. If there is more than one pending Active Stored Set, and there is no Active Stored Set in the File System, the Link 16 Waveform shall reject all of the pending Active Stored Sets except the first one established. If the transferred segment count is different from the Link 16 Waveform segment's count, The Link 16 Waveform shall proceed as in A.4.2.2.c.[SS/ICS App A V1 954]

If there remains a pending Active Stored Set, then the Link 16 Waveform will replace the Current Use Set with the pending Active Stored Set (except for retained adaptable parameters). The Link 16 Waveform shall subsequently send the Ongoing BIT and Status FOM with CURRENT INIT STATE set to Complete, Validity Test in Progress proceed to Phase 3 for validity checking. After validity checking the new Current Use Set, the Link 16 Waveform will compute the checksum and store the set in the File System as the Current Use Set and as a Stored Set. The Link 16 Waveform will indicate the CURRENT SET INDEX NUMBER of the Current Use Set in Status Word#931 and in Status Word#961. The status words 962-998 and 1000-1019 will indicate which APs have been replaced with defaults. [SS/ICS App A V1 955]

The Link 16 Waveform will then proceed to validity check any pending Inactive Stored Sets, replacing invalid data with default values stored in the File System. When it has finished checking a pending Inactive Stored Set, the Link 16 Waveform will compute its checksum and store the set in the File System. When the validity checking of a pending Inactive Stored Set will be completed, the stored set number (1021) and the status words 1022-1058 and status words

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

1060-1079 will indicate which Adaptable Parameters have been replaced with default values. [SS/ICS App A V1 956]

If requested by the Host (using a non-zero REQUEST NUMBER) in the Init Data Change FIM for a change to the Current Use Set, the Link 16 Waveform shall send the Init Data Change Acknowledgement FOM with the status of the initialization data change indicated (see A.7.2.5 of Volume II).[SS/ICS App A V1 957]

The Host may request initialization words from the Current Use Set (FIM02, REQUEST TYPE = Current Initialization Data Request) or from the Stored Sets (FIM02, REQUEST TYPE = Initialization Data Set Request). When the request is made on the Current Use Set, the Link 16 Waveform's response to the Host (See FOM04, FOM25, FOM26) will contain the Current Use Set's values contained in the local RAM. A data request made on a Stored Set N will be ignored if there is no Stored Set with the SET INDEX equal to N stored in the Link 16 Waveform.

Setting L16 chronometer from AP data (write to chronometer)

The MIDS JTRS Terminal will have a system chronometer which can receive inputs from the host control bus, an external Global Positioning System (GPS) system, or the Link 16 Waveform. To allow the MIDS JTRS Link 16 Waveform to be a “plug and play” replacement for the MIDS Low Volume Terminal (LVT), the Link 16 Waveform will provide the host the capability to load system time by modifying a Link 16 adaptable parameter. The MIDS JTRS Link 16 Waveform will have a parameter in its configuration file that determines the method the system time is set.

AP data to Red Side

The Link 16 Waveform red side processing shall be responsible for performing the processing on the adaptable parameters as described above in A.4.2.3. Once the red side has accepted a valid set of adaptable parameters, it shall forward the appropriate adaptable parameters to the black side.

Identification of operating mode (TDMA/TACAN/operational)

The Link 16 Waveform will determine its operating mode using either the setting of the Time Division Multiple Access (TDMA) STATE and TACAN STATE bits from the IPS or the value of AP004. The input/output (I/O) identifier will be used to make this determination. The Link 16 Waveform shall be instantiated independent of the setting of the operational mode. If the operational mode is TACAN only, the Link 16 Waveform shall be set to TDMA OFF. Else, the Link 16 Waveform shall be in TDMA ON.[SS/ICS App A V1 37434]

For Platform N, when an initialization data change is received for AP437 (TACAN Control Select) in the Current Use Set, setting it to value 0 ("TACAN flight control data is provided via the TACAN serial control bus"), and the Link 16 Waveform is in a “Load Complete, Valid Data” or “Load Complete, Data Conflict” state, the value of AP004 in the Current Use Set shall be updated by the Link 16 Waveform to reflect the value of the TDMA STATE and TACAN STATE bits from the IPS. During this mode, initialization data changes to AP004 in the Current

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Use Set will be ignored. Upon setting the value of AP437 back to its default value of 1 ("TACAN flight control data is provided via the Host Data Bus"), the value of AP004 will not revert to its original setting.

For all other platforms, the Link 16 Waveform shall ignore the settings of the TDMA STATE and TACAN STATE bits from the IPS and use the value of AP004 to determine the operational state.[SS/ICS App A V1 37436]

A.4.3 TACAN standalone mode initialization protocols

The Terminal shall follow a simplified initialization protocol process when it is operating in the TACAN Standalone mode. The Terminal will indicate that it is operating in the TACAN Standalone mode in the FOM03, see A.7.2.3 of Volume II. When the Terminal is operating in this mode it shall only process and accept initialization data and initialization data changes relative to operation in the TACAN Standalone mode. Initialization data validity checking and segment count checking will not be performed. No Stored Set operations will be supported in TACAN Standalone mode. The Status File will not be available to the Host in TACAN Standalone operation. During TACAN Standalone operation, the standalone initialization state will be reported to the Host via the TACAN STANDALONE INITIALIZATION STATE field of the Ongoing BIT & Status FOM (see A.7.2.3 of Volume II). During this mode of operation, the CURRENT INITIALIZATION STATE field of the Ongoing BIT & Status FOM will be set to "No Statement."

The Terminal shall begin its initialization processing after the completion of Start-Up Built-In-Test (SBIT). Three phases of initialization processing in the Terminal can be identified:

a. Phase 1 - Terminal Start-Up

The Terminal retrieves TACAN initialization data stored in TACAN non-volatile memory.

b. Phase 2 - Initialization Data Load

The Terminal processes initialization data control FIMs and processes them for TACAN relative operation. The Terminal allows the Host to input Restart Load, Load Complete, or initialization data segments, a segment being a sequence of contiguous 16-bit words of the initialization data file. Only initialization data relevant to the TACAN Standalone operation (TACAN control words, Long Term Transmit Inhibit (LTTI), TACAN On/Off, Antenna Cable Delays, Thermal Override, etc) will be processed.

c. Phase 3 - Initialization Data Changes and Requests

The Terminal allows the Host to change initialization data in the Current Use Set only.

FIGURE A-3 is a state-transition diagram that describes the overall processing of initialization data. The bubbles represent the phases (or states) and the arrows represent the transitions.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

The phases are described in more detail in the following sections. Note that references within the subsections of A.4.3 to these three phases pertain to the phases defined in A.4.3 and not A.4.2.

ICS-JC-10002 Rev -
Appendix A

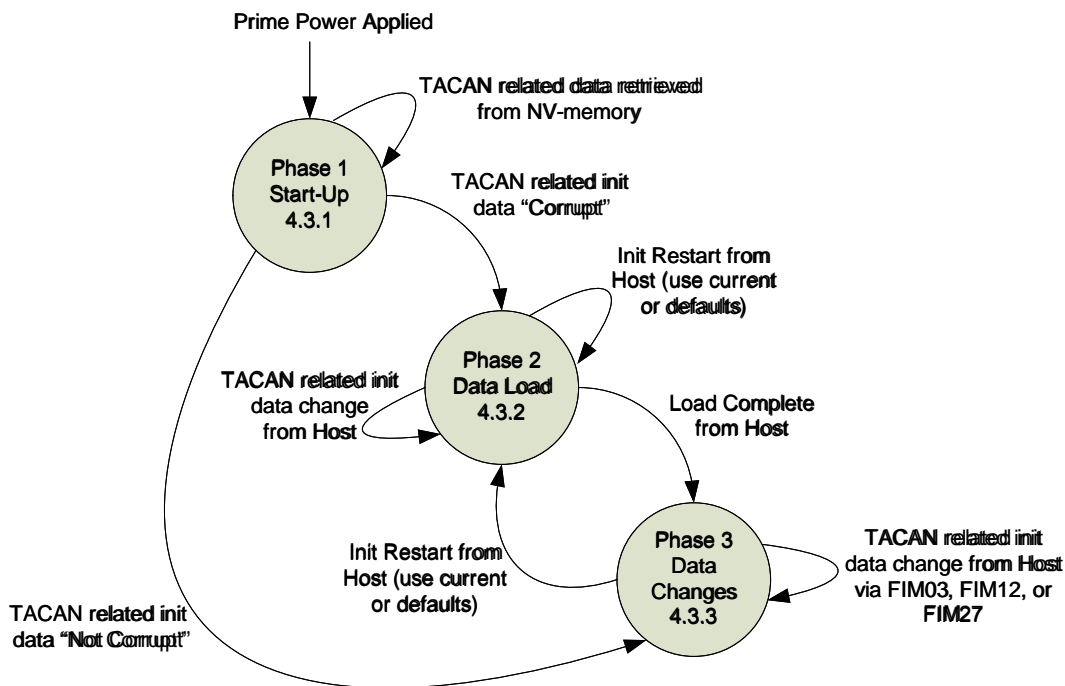

FIGURE A-3. TACAN standalone initialization protocol

A.4.3.1 TACAN standalone phase 1 - start-up

This phase is performed whenever prime power is applied and the Terminal enters the TACAN Standalone mode (See FIGURE A-4, Phase 1). The purpose of this phase is to determine the integrity of the TACAN Standalone initialization parameters stored in non volatile (NV)-memory in order to determine whether it can start using this data or if the Host has to provide new data. During this phase, the Terminal will ignore all Host inputs and in particular all Init Data Change FIMs.

The TACAN Standalone software computes the Boolean checksums of the TACAN Standalone initialization parameters stored in NV-memory. If the TACAN Standalone software computed checksum matches the checksum stored by the TACAN Standalone software in the NV-memory, the TACAN Standalone initialization parameters shall be declared "Not Corrupt"; otherwise, the TACAN Standalone initialization parameters shall be declared "Corrupt."

The TACAN Standalone software will proceed in one of two ways based on the above criteria:

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

- a. If the TACAN Standalone initialization parameters are "Not Corrupt" the TACAN Standalone software will load these initialization data parameters into local memory, send the Ongoing BIT & Status FOM (see A.7.2.3 of Volume II) with the TACAN STANDALONE INITIALIZATION STATE field set to "TACAN Standalone - Load Complete," and proceed to Phase 3.
- b. If the TACAN Standalone initialization parameters are "Corrupt," the TACAN Standalone software will load all default TACAN Standalone initialization parameters into local memory, send the Ongoing BIT & Status FOM with the TACAN STANDALONE INITIALIZATION STATE field set to "TACAN Standalone - Awaiting Load," and proceed to Phase 2.

A.4.3.2 TACAN standalone phase 2 - initialization data load

This phase is performed after Phase 1 or Phase 3. During this phase, the TACAN Standalone software allows the Host to input initialization data segments, complete the load, or restart the load. The TACAN operation is suspended while the TACAN Standalone software is in this phase, because there are no valid initialization parameters to operate with.

During this phase only FIM03 will be processed by the TACAN Standalone software; all other FIMs will not be processed.

- a. Initialization data loading:
 1. The TACAN Standalone software shall accept any number of Init Data Change FIM03s for which the LOAD COMMAND field indicates "Initialization Data Change," the FIM03's field REQUEST NUMBER will be ignored by the TACAN Standalone software and no Initialization Data Change acknowledgement FOM05 will be sent to the Host. The initialization data segments, each contained in an Initialization Data Change FIM03, may be sent in any order and may be repeated by the Host.
 2. Only initialization parameters identified in A.4.4 as operable in the TACAN Standalone mode (TACAN control words, LTTI, TACAN On/Off, Antenna Cable Delays, Thermal Override, etc) will be processed and stored by the Terminal. All other adaptable parameters will not be stored or processed in the TACAN Standalone mode.
 3. When the TACAN Standalone software is in Phase 2 (Awaiting Load), after receiving the first initialization data segment, the TACAN Standalone software will send the Ongoing BIT & Status FOM (see A.7.2.3 of Volume II) with the CURRENT INITIALIZATION STATE field set to "Load In Progress" and remain in Phase 2.
- b. Initialization Data Load termination:

Host input of initialization segments should be terminated by an Init Data Change FIM for which the LOAD COMMAND field indicates "Load Complete." Upon reception of this FIM, the TACAN Standalone software will send the Ongoing BIT & Status FOM

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

with the TACAN STANDALONE INITIALIZATION STATE field set to "TACAN Standalone Load Complete" and proceed to Phase 3.

- c. Initialization Data Load restarts:
1. When the Host issues a "Restart Load Using Defaults" the TACAN Standalone software loads all default initialization data into local memory and uses those values as initial values to process subsequent host inputs. The TACAN Standalone software sends the Ongoing BIT & Status FOM with the TACAN STANDALONE INITIALIZATION STATE field set to "TACAN Standalone Awaiting Load," and then remains in Phase 2 to allow the Host to re-enter initialization data as specified above.
 2. When TACAN STANDALONE INITIALIZATION STATE is "TACAN Standalone Awaiting Load" and the Host issues a "Restart Load Using Current Data," the TACAN Standalone software loads all default initialization data into local memory and uses those values as initial values to process subsequent host inputs. The TACAN Standalone software remains in Phase 2 to allow the Host to re-enter initialization data as specified above.
 3. When TACAN STANDALONE INITIALIZATION STATE is "TACAN Standalone Load Complete" and the Host issues a "Restart Load Using Current Data," the TACAN Standalone software uses its current initialization parameters as initial values to process host subsequent inputs. The TACAN Standalone software sends the Ongoing BIT & Status FOM with the TACAN STANDALONE INITIALIZATION STATE field set to "TACAN Standalone Awaiting Load," and then remains in Phase 2 to allow the Host to re-enter initialization data as specified above.

A.4.3.3 TACAN standalone mode phase 3 - initialization data changes

Within this phase, the TACAN Standalone software has initialization parameters to operate with and will accept all Host inputs.

The purpose of this phase is to allow the Host to change initialization data in the initialization parameters. Only FIM03, FIM12, and FIM27 will be accepted to change initialization data, and only TACAN relevant initialization data can be changed with a FIM03 or FIM27.

At any time, the Host may restart the load by sending an Initialization Data Change FIM for which the LOAD COMMAND field indicates "Restart Load Using Current Data" or "Restart Load Using Defaults." The TACAN Standalone software shall proceed to Phase 2.

The TACAN Standalone software shall accept Init Data Change FIM03 for which the LOAD COMMAND field indicates "Initialization Data Change" (see A.7.1.3 of Volume II). This will enable the Host to change the TACAN initialization data. The TACAN Standalone software will process one Initialization Data Change FIM03 at a time in the order received.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

The FIM27 shall only be processed for adaptable parameter changes that are applicable to the TACAN Standalone operation. Only the default settings for FIM27 shall be processed in the TACAN Standalone mode.

Any initialization change with no set index number will be applied against the TACAN Standalone initialization parameters. If the change is valid, the data change will be made to the TACAN Standalone initialization parameters, the checksum will be recomputed, and the data will be copied to NV-memory, the TACAN Standalone software will send to the host the Ongoing BIT & Status FOM03 with the TACAN STANDALONE INITIALIZATION STATE field set to "TACAN Standalone - Load Complete." If the change is not valid (the FIM03 or FIM27 is not applicable in the TACAN Standalone mode), the FIM03 or FIM27 will not be processed.

Any FIM12 will be applied against the TACAN Standalone initialization parameters. If the change is valid, the data change will be made to the TACAN Standalone initialization parameters, the checksum will be recomputed, and the data will be copied to NV-memory, the TACAN Standalone software will send to the host the Ongoing BIT & Status FOM03 with the TACAN STANDALONE INITIALIZATION STATE field set to "TACAN Standalone - Load Complete."

If requested by the Host (using a non-zero REQUEST NUMBER) in the Init Data Change FIM for a change to the TACAN Standalone initialization parameters, the TACAN Standalone software shall send the Init Data Change Acknowledgement FOM with the status of the initialization data change indicated (see A.7.2.5 of Volume II).

If any of the initialization data parameters being monitored by the Host system are updated, the Terminal shall update the Init Data Monitoring 1 FOM (FOM 25) as defined within section A.7.2.25 of Volume II using the default values of AP600 (A4.4.93). Section A.7.2.25 also defines the rules associated with the identification of the initialization data parameters that are monitored during TACAN Standalone mode.

A.4.3.4 Identification of operating mode

The TACAN Standalone software will determine its operating mode using either the setting of the TACONOFF discrete or the value of AP004. The I/O Identifier will be used to make this determination.

For Platforms N, when an initialization data change is received for AP437 (TACAN Control Select) in the initialization parameters, setting it to value 0 ("TACAN flight control data is provided via the TACAN serial control bus"), and the TACAN Standalone software is in a "TACAN Standalone Load Complete" state, the value of AP004 in the Current Use Set shall be updated by the TACAN Standalone software to reflect the value of the TDMA STATE and TACAN STATE bits from the IPS. During this mode, initialization data changes to AP004 in the initialization parameters will be ignored. Upon setting the value of AP437 back to its default value of 1 ("TACAN flight control data is provided via the Host Data Bus"), the value of AP004 will not revert to its original setting.

A.4.3.5 Transition from TACAN standalone mode to run mode

There are four combinations of transitions from the TACAN Standalone mode to the Link 16 Run mode. They are shown in TABLE A-I. The five possible outcomes of the four transition combinations are detailed in TABLE A-II to TABLE A-VI.

NOTE: During the transition process, the host data bus may set the Busy Bit for up to two bus cycles. See A.9.2.1.3.8 of Volume III for a description on the Busy Bit for Platform A.

TABLE A-I. Transitions from TACAN standalone to Link 16 operational

Transition	TACAN STANDALONE INITIALIZATION STATE at time of Link 16 becoming operational	CURRENT INITIALIZATION STATE at time of Link 16 becoming operational	Resulting CURRENT INITIALIZATION STATE
1	TACAN Standalone Awaiting Load	Awaiting Load	Awaiting Load. TACAN Standalone stops running and normal initialization protocols are followed, see A.4.2.
2	TACAN Standalone Awaiting Load	Load Complete, Valid Data	Load Complete, Valid Data. TACAN becomes operational using the data from the Current Use Set. TACAN related initialization data copied to TACAN Standalone NV-memory for future use.
3	TACAN Standalone Load Complete	Awaiting Load	Awaiting Load. TACAN Standalone remains operational concurrent with Link 16, until Link 16 becomes Load Complete, Valid Data. This allows TACAN to continue running. When the Link 16 Current Use Set does become Load Complete, Valid Data, it will be with the TACAN control data from TACAN Standalone initialization data words 1868 - 1870, except AP293.
4	TACAN Standalone Load Complete	Load Complete, Valid Data	Load Complete, Valid Data. TACAN Standalone initialization data words 1868 - 1870 applied to Current Use Set, except AP293.

A.4.4 Initialization data set content

The detailed content of each initialization data set is contained in this section. Each set is identified by its AP364 SET INDEX NUMBER in Word#30. FIGURE A-4 provides a summary of the initialization data set layout. Initialization data is grouped on a functional basis into words. The shaded part indicates the words which have already been allocated to Terminal functions.

TABLE A-VII to TABLE A-LXXIV identify the initialization words contained in the initialization data file. The content of each initialization word is defined in subsequent sections. Initialization data words are described individually or in functionally cohesive groups. The description consists of:

- a. a pictorial representation of the word(s) with the fields indicated and named. Field names are as descriptive as possible in the space available in the figure. Acronyms or abbreviations are often used when the full field name will not fit in the figure. Fields which are shaded and contain a "0" are reserved for Terminal use. Fields simply containing a "0" are spare fields available for future initialization data. Fields which are reserved or spare should be set to zero in any initialization data sent from the Host to the Terminal.
- b. a detailed field specification for all fields, except those which are spare or reserved, appearing in the word(s). A reference to the System Specification (SS) is given for each field. The data type of each field is specified. For coded or Boolean type fields, the meanings of the possible values are listed. For integer type fields, the range and units are provided. The default value stored in Terminal Electrically Erasable Programmable Read Only Memory (EEPROM) is provided. A comments section provides additional information about the field if necessary.

TABLE A-LXXIV. Adaptable parameters whose settings are not stored in the file system

ICS SECTION	ADAPTABLE PARAMETER	USAGE
4.4.3	Network Time Reference (NTR) (AP015)	Designates the one terminal in the network that transmits the J0.0 every 12 seconds and, for networks whose timing is not based on an external time reference, acts as the time reference for the entire network. This adaptable parameter will be stored in NVRAM for stored sets.
4.4.74	BIT (AP235)	Used to initiate Built-In-Tests
4.4.75	Net Number (AP366)	AP365 and AP366 are used together to command changes to the net numbers (AP366) of all time slot assignments for the Participation Group (PG) specified by AP365
4.4.75	PG Index Number (AP365)	See AP366 usage above.
4.4.75	SDU Zeroize (AP413)	Erases cryptovariables
4.4.75	IPF Reset (AP319)	Performs Interference Protection Feature (IPF) reset
4.4.75	Navigation Reset (AP320)	Performs Nav reset
4.4.75	Net Entry Reset (AP321)	Restarts initial entry
4.4.75	Transmit PG Queues 1-10 Clear (AP401)	Clears transmission queue from 1 to 10
4.4.75	Transmit PG Queue X Clear (AP402-411)	Clears transmit PG X queue (where X is in 1 to 10)
4.4.75	Transmit Other PGs Queue Clear (AP412)	Clears Other PGs queue
4.4.75	BIT File Control (AP439)	Clears selected BIT data storage files
4.4.77	Start Net Entry (SNE) (AP353)	Used to initiate network entry
4.4.77	Thermal Override (AP354)	Overrides thermal overload protection
4.4.80	Time Of Day validity (AP285)	Validity indicator for Time Of Day values used to update the chronometer
4.4.81	Time Of Day Error Validity Indicator (AP289)	Validity indicator for error associated with Time Of Day used to update the chronometer
4.4.82	Power Test (AP293)	TACAN Information from the Host.

UNCLASSIFIED

Appendix A

A.4.4.1 Radio frequency (RF) mode (word #1)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
1	0	TEST MODE	TRANSMIT MODE	LTTI	TERMINAL STATE		0	RESERVED	IPF	RANGE MODE	COMM MODE					
					LINK 16	TACAN										

Field TEST MODE

Identifier: AP002

Ref.: SS-JC-10002 Adaptable Parameter "Test mode"; SS-JC-10002 3.2.1.1.1.3.4

Type: Coded

Values:

Value	Meaning
0	No Test Messages
1	Test Mode 1
2	Test Mode 2
3	Not Used

Default: 0

Comments:

Field TRANSMIT MODE

Identifier: AP003

Ref.: SS-JC-10002 Adaptable Parameter "TDMA transmit mode"; SS-JC-10002 3.2.1.1.1.3.2

Type: Coded

Values:

Value	Meaning
0	Not Used
1	Normal
2	Polling
3	TDMA Silent

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
4	Conditional Radio Silence
5-6	Not Used
7	Reserved

Default: 1

Comments: TDMA Transmit Mode. This adaptable parameter will not be used when the Terminal is in Long Term Transmission Inhibit (AP383) or when the Terminal State (AP004) is "TACAN only."

Field LONG TERM TRANSMIT INHIBIT (LTTI)

Identifier: AP383

Ref.: SS-JC-10001 Adaptable Parameter "LTTI Control";
SS-JC-10002 3.2.3.2.1

Type: Coded

Values:

Value	Meaning
0	No Statement
1	Transmission inhibit

Default: 0

Comments: If the corresponding Long Term Transmit Inhibit discrete input (4.2.4.8.6) is set to Inhibit, then the setting of this parameter shall not override or reset the established LTTI state.[SS/ICS App A V1 8452]

AP383 is supported in the TACAN Standalone operation mode.

Field TERMINAL STATE

Identifier: AP004

Ref.: SS-JC-10001 Adaptable Parameter "Terminal State"
SS-JC-10002 3.2.3.1

Type: Coded

Values:

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Bit 8 Link 16 State	Bit 7 TACAN State	Meaning
0	0	Link 16 and TACAN Terminal Operational
0	1	Link 16 Terminal Operational
1	0	TACAN Terminal Operational
1	1	Link 16 and TACAN are not Operational

Default: 0

Comments: MIDS JTRS State – Link 16 and/or TACAN.

Bit 7 - Applicable only when the TACAN Waveform is operational.

Bit 8 - Applicable only when the Link 16 Waveform is operational.

Terminal Standby and Terminal Off are other states which cannot be selected by an adaptable parameter.

For Platform N, when an initialization data change is received for AP437 (TACAN Control Select) in the Current Use Set, setting it to its default value 0 ("TACAN flight control data is provided via the TACAN serial control bus"), when the Terminal is in a "Load Complete, Valid Data" or "Load Complete, Data Conflict" state, the value of AP004 in the Current Use Set shall automatically be updated by the Terminal to reflect the value of the IPS output discretes. The IPS discretes represent the state of the TDMA Power ON and TACAN ON/OFF discretes from the control interface.[SS/ICS App A V1 8486]

During this mode, initialization data changes to AP004 in the Current Use Set shall be ignored.[SS/ICS App A V1 37437]

Upon setting the value of AP437 to the value of 1 ("TACAN flight control data is provided via the Host Data Bus"), the value of AP004 shall not revert to its original setting.[SS/ICS App A V1 37438]

Field INTERFERENCE PROTECTION FEATURE (IPF)

Identifier: AP006

Ref.: SS-JC-10002 Adaptable Parameter "Electromagnetic Compatibility (EMC) protection Mode";
SS-JC-10002 3.2.1.1.1.22

Type: Coded

Values:

Value	Meaning
0	Full EMC Protection

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
1	Exercise EMC Protection
2	Combat EMC Protection
3	Full EMC Protection

Default: 3

Comments: Some of the transitions between these four states require the Terminal to perform an "automatic restart" (i.e. the Terminal will perform validity checking of the current initialization data according to A.4.2.3 of this document).

Field RANGE MODE

Identifier: AP007

Ref.: SS-JC-10002 Adaptable Parameter "Range mode"; SS-JC-10002 3.2.1.1.1.3.3

Type: Coded

Values:

Value	Meaning
0	Normal Range
1	Extended Range

Default: 0

Comments: TDMA Range Mode.

Field COMMUNICATION MODE (COMM MODE)

Identifier: AP008

Ref.: SS-JC-10002 Adaptable Parameter "Communication mode"; SS-JC-10002 3.2.1.1.1.3.6

Type: Coded

Values:

Value	Meaning
0	Reserved for Terminal use (LVT2)
1	Mode 1
2	Mode 2
3	Mode 4

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Default: 1
Comments: Communication Mode 4 requires a special build of the CSS to support this function.

A.4.4.2 Primary source track number (word #2)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word	PRIMARY SOURCE TRACK NUMBER															
2	0															

Field PRIMARY SOURCE TRACK NUMBER

Identifier: AP009
Ref.: SS-JC-10002 Adaptable Parameter "Primary STN of the host or of the Terminal";
SS-JC-10002 3.2.1.1.1.2.7, 3.2.1.1.1.15.1 & 3.2.1.1.1.14.2
Type: Unsigned Integer
Range: 0 to 32767
Default: 0
Comments: Primary Source Track Number (STN) consists of five octal digits (00000_{oct} to 77777_{oct}):
Digit 5 - Bits 2-0
Digit 4 - Bits 5-3
Digit 3 - Bits 8-6
Digit 2 - Bits 11-9
Digit 1 - Bits 14-12
(00000)_{oct} = No Statement
A unique Primary Source Track Number should be provided to each Terminal for proper network operation. Legal values for this are defined in Standardization Agreement (STANAG) 5516.

A.4.4.3 Terminal function word 1 (word #3)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
3	0	ANT SWITCH	0	OUTPUT POWER MODE			0			RFO	PPLI POOL	NTR	PR	NAV		

Field ANTENNA SWITCH (ANT SWITCH)

Identifier: AP012
Ref.: SS-JC-10002 Adaptable Parameter "Automatic switch to antenna interface if High Power Amplifier (HPA) faulty";
SS-JC-10002 3.2.1.1.1.21.2.g
Type: Boolean
Values: Logic 1 = Enabled
Logic 0 = Not enabled
Default: 0
Comments: Automatic switch to the antenna interface if the HPA is unable to transmit.

Field OUTPUT POWER MODE

Identifier: AP011
Ref.: SS-JC-10002 Adaptable Parameter "Output power mode";
SS-JC-10002 3.2.1.1.1.3.7, SS-JC-10002 3.2.1.1.1.21
Type: Coded
Values:

Value	Meaning
0	Normal Power (Terminal)
1	Low Power
2	High Power (HPA)
4	Mixed Power
5	Medium Power
6	Low Power (HPA)

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Default: 0

Comments: Codes not defined above are not used.

If "Mixed Power" mode is selected, the MIDS power is defined by the AP137 in Transmit PG Related Data adaptable parameters. If the EMC Features Mode is set to full protect, the waveform will not allow mixed power transmissions between the HPA and RT.

Field RECORDER FUNCTION ON (RFO)

Identifier: AP013

Ref.: SS-JC-10002 Adaptable Parameters "Recorder function on";
SS-JC-10002 3.2.5.2.7

Type: Boolean

Values: Logic 1 = Recorder Function On
Logic 0 = Recorder Function Off

Default: 0

Comments: When the Terminal is in sanitization mode (SS-JC-10002 3.2.1.1.1.4.10), the update of this AP is not used by the Terminal. Nevertheless, the updated value is processed at the end of the sanitization mode if the update has been accepted by the Terminal.

Field PPLI POOL

Identifier: AP014

Ref.: SS-JC-10002 Adaptable Parameters "PPLI Pool"; SS-JC-10002 3.2.1.1.1.12.3.2.b

Type: Coded

Values:

Value	Meaning
0	Pool (A+B)
1	Pool B

Default: 1

Comments: Precise Participant Location & Identification (PPLI) and Status pool selection.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field NETWORK TIME REFERENCE (NTR)

Identifier: AP015
Ref.: SS-JC-10002 Adaptable Parameter "Network time reference";
SS-JC-10002 3.2.1.1.1.5.3, SS-JC-10002 3.2.1.1.1.17.7.1, SS-JC-10002
3.2.1.1.1.17.7.2
Type: Boolean
Values: Logic 1 = Terminal assigned as Network Time Reference
Logic 0 = Terminal not assigned as Network Time Reference
Default: 0
Comments: Network Time Reference function enable.
For the Terminal's transmission limitation (AP003 Transmit Mode, AP383 LTTI, or LTTI discrete), refer to TABLE A-CLII. This parameter is not stored in the File System and shall not be reinstated after a power interruption longer than 10 seconds; after the power-on interface is set to off for more than 10 seconds; after the transmit mode adaptable parameter is set to conditional radio silence, polling or TDMA silence; or after long term transmit inhibit is set. However, the value of the NTR parameter can be stored in a stored set and made operational by the activation of a stored set in which its value is logic 1. [SS/ICS App A V1 8745]

Field POSITION REFERENCE (PR)

Identifier: AP016
Ref.: SS-JC-10002 Adaptable Parameter "Position reference";
SS-JC-10002 3.2.1.1.1.17.7.1
Type: Boolean
Values: Logic 1 = Terminal assigned as Position Reference
Logic 0 = Terminal not assigned as Position Reference
Default: 0
Comments: Position Reference function enable.

Field NAVIGATION (NAV)

Identifier: AP017
Ref.: SS-JC-10002 Adaptable Parameters "Navigation user type";
SS-JC-10002 3.2.1.1.1.17.7.1, SS-JC-10002 3.2.1.1.1.17.7.4 to SS-JC-10002
3.2.1.1.1.17.7.7
Type: Coded
Values:

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
0	Not Used
1	Secondary User
2	Primary User
3	Not Used
4	Reserved
5	Reserved
6,7	Not Used

Default: 2

Comments: Navigation function organizational user type. Codes not defined above are not used. For the restrictions resulting from automatic changes, refer to TABLE A-CLII.

4	0					ONMR	IEG	RPS	OTAR	RESERVED	SEQUENCE NUMBER	NETE	ETR	TRP		

Field OVER-THE-AIR NETWORK MANAGEMENT REJECTION (ONMR)

Identifier: AP443

Ref.: SS-JC-10002 Adaptable Parameters "Over-the-air network management message rejection"; SS-JC-10002 3.2.1.1.8.3.4.p

Type: Boolean

Values:

Value	Meaning
Logic 0	Accept all over-the-air network management messages for further processing
Logic 1	Reject all over-the-air network management messages

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Default: Logic 0
Comments: When set to logic 1, the Terminal shall reject all network management (J0.3, J0.4, J0.6C3 and J0.6C4) messages that are received over-the-air and are addressed to its primary source track number (AP009).

Field INITIAL ENTRY GROUP (IEG)

Identifier: AP067
Ref.: SS-JC-10002 Adaptable Parameter "Initial entry message transmit enable";
SS-JC-10002 3.2.1.1.1.8.3.3.2.b
Type: Coded
Values:

Value	Meaning
0	Transmit Link 16 Initial Entry Message Only
1	Transmit Link 16 and IJMS Initial Entry Message on alternate frames

Default: 0
Comments:

Field REKEYING PROCESSING STATUS (RPS)

Identifier: AP018
Ref.: SS-JC-10002 Adaptable Parameter "Rekeying processing status";
SS-JC-10002 3.2.1.1.1.13
Type: Boolean
Values: Logic 1 = On
Logic 0 = Off
Default: 0
Comments: When this parameter is set, the Terminal shall notify the Host that the rekeying processing has been successfully completed by means of FOM03, Ongoing BIT & Status FOM.[SS/ICS App A V1 8878]

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field OVER THE AIR REKEYING (OTAR)

Identifier: AP019
Ref.: SS-JC-10002 Adaptable Parameter "Over the air rekeying"; SS-JC-10002 3.2.1.1.1.13.a
Type: Boolean
Values: Logic 1 = OTAR Enabled
Logic 0 = OTAR Not Enabled
Default: 0
Comments:

Field SEQUENCE NUMBER

Identifier: AP021
Ref.: SS-JC-10002 Adaptable Parameter "Sequence number of current cryptoperiod"; SS-JC-10002 3.2.1.1.1.4.6.2, SS-JC-10002 3.2.1.1.1.4.6.3
Type: Coded
Values:

Value	Meaning
0	24 Hour Period
1-7	Represents Current Day Number

Default: 0
Comments: Sequence Number designator of current cryptoperiod. If this field is not zero, the host setting of this field shall be overridden by the Terminal computed SEQUENCE NUMBER in accordance with SS-JC-10002 3.2.1.1.1.4.6.4.c provided that the host has given a date. If the SEQUENCE NUMBER field is non-zero, the Terminal shall increment the parameter by one (or from 7 to 1) during the Midnight transition from one day to another. Refer to TABLE A-CLII.

Field NET ENTRY TRANSMIT ENABLE (NETE)

Identifier: AP022
Ref.: SS-JC-10002 Adaptable Parameter "Initial entry message transmit enable"; SS-JC-10002 3.2.1.1.1.5.4.1, 3.2.1.1.1.6.5 & 3.2.1.1.1.8.3.3.2
Type: Boolean
Values:

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
0	Do not transmit Net Entry Message
1	Transmit Net Entry Message

Default: 0

Comments: When the NTR field (AP015) is set to Logic 1 (Terminal assigned as NTR), or the Terminal is an active Main Net Relay (SS-JC-10002 3.2.1.1.1.8.4.3.2), the setting of this field is irrelevant.

Field EXTERNAL TIME REFERENCE (ETR)

Identifier: AP023

Ref.: SS-JC-10002 Adaptable Parameter "External time standard";
SS-JC-10002 3.2.1.1.1.5.2

Type: Boolean

Values: Logic 1 = Use External Time Reference
Logic 0 = Do not use External Time Reference

Default: 0

Comments: When the ETR is set to logic 1, the Terminal is enabled to use External Time Reference data as a Kalman filter observation. Even if designated as the Net Time Reference by AP015, the Terminal estimates its synchronization state and transmits a time quality that is derived from its Kalman filter covariance.
When the ETR is set to logic 0, the Terminal shall not use ETR data as a Kalman filter observation. If designated as the NTR, the Terminal shall not estimate synchronization states and shall transmit a time quality of 15.

Field TAPE RECORDER PORT SELECTION (TRP)

Identifier: AP024

Ref.: SS-JC-10002 Adaptable Parameter "Recorder function on databus" and "Recorder function on support port";
SS-JC-10002 3.2.5.2.7

Type: Coded

Values:

Value	Meaning
0	Host Data Bus
1	Support Port

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Default: 0

Comments: When AP013 RECORDER FUNCTION ON is set to "On" this field specifies whether the recording is to be done via the support port or via the databus. When the Terminal is in sanitization mode (SS-JC-10002 3.2.1.1.1.4.10), the update of this AP is not used by the Terminal. Nevertheless, the updated value is processed at the end of the sanitization mode if the update has been accepted by the Terminal.

A.4.4.17 Initialization set word (word #30)

The Terminal may have up to 8 stored initialization data sets in addition to the Current Use Set. This word is used by the host to indicate to the Terminal if a stored set is to be set to "active (SAI = 1)" or to "non-active (SAI = 0)" and is used by the Terminal to identify whether a stored set is "active" or not. This word is used by the Terminal to indicate which stored set the Current Use Set was derived from. See A.4.2 for details.

SS-JC-10002 3.2.1.1.1.20.3.1.2.e.2, SS-JC-10002 3.2.1.1.1.20.3.1.3.b

Type: Unsigned Integer

Range: 0 to 32767

Default: 0

Comments: Secondary Source Track Number consists of five octal digits (00000_{oct} to 77777_{oct}):

Digit 5 - Bits 2-0

Digit 4 - Bits 5-3

Digit 3 - Bits 8-6

Digit 2 - Bits 11-9

Digit 1 - Bits 14-12

(00000)_{oct} = No Statement

Legal values for this are defined in STANAG 5516.

A.4.4.19 Repromulgation word (word #47)

Word																
47	0									CNTRL	REPROM STATE	ORIGINAL REPROMULGATION COUNTER				

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field REPROMULGATION RELAY CONTROL COUNTER (CNTRL)

Identifier: AP053
Ref.: SS-JC-10002 Adaptable Parameter "Repromulgation relay counter control";
SS-JC-10002 3.2.1.1.1.9.3
Type: Boolean
Values: Logic 1 = Decrement Repromulgation Count
Logic 0 = Do Not Decrement Repromulgation Count
Default: 0
Comments: This field controls the setting of the Repromulgation Count prior to any repromulgation relay. If the message qualifies for repromulgation relay (see the REPROMULGATION STATE field), the Terminal shall set the Repromulgation Count in the outgoing message as follows:[SS/ICS App A V1 10324]
Logic 1 = Decrement Repromulgation Count by 1
Logic 0 = Set Repromulgation Count to 1

Field REPROMULGATION STATE (REPROM STATE)

Identifier: AP054
Ref.: SS-JC-10002 Adaptable Parameter "Repromulgation relay state for non Needline PG";
SS-JC-10002 3.2.1.1.1.9.2.1
Type: Coded
Values:

Value	Meaning
0	Inactive
1	Relay Only
2	Originate Only
3	Relay and Originate

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Default: 0

Comments: Specifies level of Terminal participation in the Repromulgation Community. The Terminal shall perform repromulgation relay provided: (1) the REPRO STATE field is set to "Relay Only" or "Relay and Originate"; (2) the current Repromulgation Count in the received message is positive; and (3) the message was not previously repromulgation relayed by the Terminal.

In order to transmit J1.2 (Route Establishment) messages on the allocated PG (AP234 - Route Establishment PG Index - A.4.4.58), AP054 must be set to value 2 (Originate only) or value 3 (Relay and Originate).

Field ORIGINAL REPROMULGATION COUNTER

Identifier: AP052

Ref.: SS-JC-10002 Adaptable Parameter "Original repromulgation counter";
SS-JC-10002 3.2.1.1.1.9.1, SS-JC-10002 3.2.1.1.1.9.2.2

Type: Unsigned Integer

Default: 8

Range: 1 to 15

Comments: This field controls the setting of the Original Repromulgation Counter (as specified in SS-JC-10002 paragraph 3.2.1.1.1.9.2.2).

Fields NON-C2 JU TO NON-C2 JU PG STATUS A/B (NSA/NSB)

Identifier: AP460/AP462
Ref.: SS-JC-10002 Adaptable Parameter "Non-C2 JU to non-C2 JU PG Status A/Non-C2 JU to non-C2 JU PG Status B";
SS-JC-10002 3.2.1.1.1.12.3.2.1 and SS-JC-10002 3.2.1.1.1.8.3.3.14c
Type: Boolean
Range/Units: Logic 1 = Inactive
Logic 0 = Active
Default: Logic 1
Comments: For air platforms only, these two fields are provided by a non-C2 platform. Status shall be reported in the J2.2 message in accordance with 3.2.1.1.1.12.3.2.1.[SS/ICS App A V1 53452]

Field MISSION CORRELATOR

Identifier: AP463
Ref.: SS-JC-10002 Adaptable Parameter "Mission correlator";
SS-JC-10002 3.2.1.1.1.20.2.2.2
Type: Unsigned Integer
Range/Units: 0 to 255
(0 = no statement)
Default: 0
Comments: Specifies the identifying number assigned to an overall mission, which enables participants with different objectives on specific missions to be associated with the same overall mission. Defined in STANAG 5516 Annex E - Data Element Dictionary (Data Field Identifier 725; Data Use Identifier 003). For an air platform, whose PPLI message is the J2.2, this field is mapped from initialization word 51, bits 0-7, into the J2.2C5 word, bits 15-22. For a non-air platform, whose PPLI message is either the J2.3, J2.4, J2.5 or J2.6, this field is mapped from initialization word 50, bits 0-7, into the PPLI message's I word, bits 53-60.

Field WINGMAN IDENTIFICATION LETTER/NUMBER

Identifier: AP464
Ref.: SS-JC-10002 Adaptable Parameter "Wingman identification letter/number";
SS-JC-10002 3.2.1.1.1.20.2.2.2
Type: Alphanumeric Character (per STANAG 5516)
Range/Units: 0 to 63
(0 = no statement)
Default: 0
Comments: For air platforms only (J2.2 message), a letter or number assigned to a specific non-C2 JU. Defined in STANAG 5516 Annex E - Data Element Dictionary (Data Field Identifier 731; Data Use Identifier 001).

Field MISSION COMMANDER TRACK NUMBER

Identifier: AP465
Ref.: SS-JC-10002 Adaptable Parameter "Mission commander track number";
SS-JC-10002 3.2.1.1.1.20.2.2.2
Type: Unsigned integer
Range/Units: 0 to 77777 (octal)
(0 = no statement)
Default: 0
Comments: For air platforms only (J2.2 message), the TN of the commander of a mission of which the message originator is a member (could be own TN). Defined in STANAG 5516 Annex E - Data Element Dictionary (Data Field Identifier 769; Data Use Identifier 041).

Field FLIGHT LEAD TRACK NUMBER

Identifier: AP466
Ref.: SS-JC-10002 Adaptable Parameter "Flight lead track number";
SS-JC-10002 3.2.1.1.1.20.2.2.2
Type: Unsigned integer
Range/Units: 0 to 77777 (octal)
(0 = no statement)
Default: 0
Comments: For air platforms only (J2.2 message), the TN of the leader of the flight of which the message originator is a member (could be own TN). Defined in STANAG

A.4.4.23 EMC features parameters (word #54)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
54	SPARE		URR	UCR	UTN	URA	URB	UP4	NET USAGE CONTROL							

Note: For all fields in the EMC Features Parameters Word (Word 54), they are only processed by the Link 16 Waveform when the EMC Features Mode is set to "Full Protect." For all other EMC Modes, this word is ignored by the waveform.

Field NET USAGE CONTROL

Identifier: AP467

Ref.: SS-JC-10002 Adaptable Parameter "Net Usage Control";
SS-JC-10002 3.2.1.1.1.22.5.8.a

Type: Unsigned Integer

Values: 0 to 126 (127 is invalid)

Default: 126

Comments: Determines range of allowed net numbers in time slot and paired slot relay assignments. Net 127 is an invalid net usage control adaptable parameter.

Field USE OF 444-PULSE TRANSMISSIONS (UP4)

Identifier: AP468

Ref.: SS-JC-10002 Adaptable Parameter "Use of 444 Pulse Transmissions";
SS-JC-10002 3.2.1.1.1.22.5.7.a

Type: Boolean

Values: Logic 0 = Unrestricted (Allow)
Logic 1 = Restricted (Do Not Allow)

Default: 0 (Allow)

Comments: Indicates whether to allow or disallow packed-2 (P2) double pulse (DP), packed-4 (P4) single pulse (SP) or 444-pulse Link 16 enhanced throughput (LET) transmissions.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field USE OF RTT-B_TRANSMISSIONS (URB)

Identifier: AP469
Ref.: SS-JC-10002 Adaptable Parameter "Use of RTT-B Messages ";
SS-JC-10002 3.2.1.1.1.22.5.7.c
Type: Boolean
Values: Logic 0 = Unrestricted (Allow)
Logic 1 = Restricted (Do Not Allow)
Default: 0 (Allow)
Comments: Indicates whether to allow or disallow Round Trip Timing (RTT)-B transmissions.

Field USE OF RANDOM (CONTENTION) ACCESS MODE (URA)

Identifier: AP470
Ref.: SS-JC-10002 Adaptable Parameter "Use of random (contention) access mode";
SS-JC-10002 3.2.1.1.1.22.5.10.1
Type: Boolean
Values: Logic 0 = Do Not Allow
Logic 1 = Allow
Default: Logic 0 (Do Not Allow)
Comments: Specifies whether to accept or reject transmit time slot assignments (TSAs) that would result in contention-access transmissions. (Does not apply to RTT-B transmit assignments or inhibit initial entry message transmission if the net entry enable adaptable parameter is set to transmit net entry message.)

Field USE OF TSR NON-CENTRALIZED MODE (UTN)

Identifier: AP471
Ref.: SS-JC-10002 Adaptable Parameter "Use of non-centralized TSR access mode";
SS-JC-10002 3.2.1.1.1.22.5.10.2.a
Type: Boolean
Values: Logic 0 = Restricted (Do Not Allow)
Logic 1 = Unrestricted (Allow)
Default: Logic 0 (Do Not Allow)
Comments: Indicates whether to allow or not allow Time Slot Reallocation (TSR) non-centralized mode operation. If set to Restricted (do not allow) and the centralized mode operation adaptable parameter for a pool is set to "disabled," the Terminal shall change the operate/suspend adaptable parameter (AP108) to suspend.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field USE OF CONDITIONAL RELAY MODE (UCR)

Identifier: AP472
Ref.: SS-JC-10002 Adaptable Parameter "Use of Conditional Paired Slot Relay (CPSR)";
SS-JC-10002 3.2.1.1.1.22.5.9.1
Type: Boolean
Values: Logic 0 = Do Not Allow
Logic 1 = Allow
Default: Logic 0 (Do Not Allow)
Comments: Indicates whether to allow or disallow conditional paired-slot-relay assignments.

Field USE OF REPROMULGATION RELAY (URR)

Identifier: AP606
Ref.: SS-JC-10002 Adaptable Parameter "EMC repromulgation relay control";
SS-JC-10002 3.2.1.1.1.22.5.9.2.a
Type: Boolean
Values: Logic 0 = Do not allow
Logic 1 = Allow
Default: Logic 0 (Do not allow)
Comments: This field is a software EMC feature that controls repromulgation relay of received messages.

Field INERTIAL NAVIGATION SYSTEM (INS TYPE)

Identifier: AP425

Ref.: SS-JC-10002 Adaptable Parameter "INS type"; SS-JC-10002 3.2.1.1.1.17.4.a

Type: Coded

Values:

Value	Meaning	Velocity process noise spectral density (ft ² /s ³)	X,Y misalignment process noise spectral density (rad ² /s)	Z misalignment process noise spectral density (rad ² /s)
0	No Statement	-	-	-
1	Very Poor INS	1.699 10 ⁻⁴	6.144 10 ⁻¹³	6.390 10 ⁻¹³
2	Poor INS	1.648 10 ⁻⁴	2.467 10 ⁻¹³	2.597 10 ⁻¹³
3	Medium INS	7.914 10 ⁻⁵	8.954 10 ⁻¹⁴	8.965 10 ⁻¹⁴
4	Good INS	2.634 10 ⁻⁵	8.842 10 ⁻¹⁵	8.343 10 ⁻¹⁵
5	Excellent INS	1.696 10 ⁻⁶	1.212 10 ⁻¹⁵	9.400 10 ⁻¹⁶
6-7	Not Used	-	-	-

Default: 0

Comments: The Terminal will not process this field for Platforms A, I, L, and N, which should set this field to "No statement." For Platforms A, L, and N, the Terminal uses Horizontal Velocity Source via FIM10. For Platform I, the Terminal uses a fixed value that is stored in software.

This field is used in the Terminal to define MIDS Kalman Filter process noises as specified in the table above. Note this field is required for Inertial and non-inertial navigation systems; in that latter case, not all entries in the Values table are applicable.

Field INS ALIGNMENT TYPE

Identifier: AP430

Ref.: SS-JC-10002 Adaptable Parameter "INS alignment type"; SS-JC-10002 3.2.1.1.1.17.4.a

Type: Coded

Values:

UNCLASSIFIED
FOR OFFICIAL USE ONLY

6-7	Not Used	-	-	-	-	-	-	-	-	-	-

Default: 0

Comments: Gives the accuracy of INS alignment mode.

The Terminal will not process this field for Platforms A, I, L, and N, which should set this field to No Statement. For Platforms A, L and N, the Terminal uses INS Alignment via FIM10. For Platform I, the Terminal uses INS Alignment via FIM35.

The Terminal uses this field only if the navigation system is inertial or aided inertial.

This field is used by the Terminal to define INS Error Budget for MIDS Kalman Filter as shown in the Values table.

Field INS ALIGNMENT STATUS

Identifier: AP431

Ref.: SS-JC-10002 Adaptable Parameter "INS alignment status"; SS-JC-10002 3.2.1.1.1.17.4.a

Type: Coded

Values:

Value	Meaning
0	No Statement
1	Alignment Complete
2	Alignment in Progress

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
3	Alignment not complete
4-7	Not Used

Default: 0

Comments: Gives the state of INS alignment process.

The Terminal will not process this field for Platforms A, I, L, and N, which should set this field to No Statement. For Platforms A, L, and N, the Terminal uses Alignment in Progress via FIM10. For Platform I, the Terminal uses Alignment in Progress via FIM35.

The Terminal uses this field only if the navigation system is inertial or aided inertial.

Field NAVIGATION SYSTEM TYPE (NAV SYS TYPE)

Identifier: AP283

Ref.: SS-JC-10002 Adaptable Parameter "Navigation system type"; SS-JC-10002 3.2.1.1.1.17.4.a

Type: Coded

Values:

Value	Meaning	Navigation system correspondences		
		Platform Type A/I/L/N	Reserved	Reserved
0	TOA-only	No Statement	None	None
1	Non-Inertial	Not Used	EF2000 FCC	Not Used
2	Inertial	Not Used	EF2000 LINS	INS
3	Aided Inertial	Not Used	GPS-Aided INS	Not Used
4-7	Not Used	Not Used	Not Used	Not Used

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Default: 0

Comments: The Terminal will not process this field for Platforms A, I, L and N, which should set this field to No Statement. For Platform A, the Terminal uses Horizontal Velocity Source via FIM10 and Platform (AP065). For Platforms L and N, the Terminal uses Horizontal Velocity Source via FIM10. For Platform I, the Terminal uses Horizontal Velocity Source via FIM35.

Note that the Terminal may switch to Time of Arrival (TOA)-only by itself when the host data are not valid for a longer time than Flywheel time. Flywheel time is the time period used by the Terminal to determine whether or not there has been a Host Nav failure (when Dead Reckoning (D/R) data from the Host has been interrupted) and after which a switch to TOA-only mode is made. Flywheel time is 4 seconds.

Note also, this AP is used to know relation between local level coordinate frame and North/West/Up (NWU) frame (NAV mechanization).

When Dead Reckoning data from the Host of the same NAV SYS TYPE are valid again after the switch to TOA-Mobile when the flywheel time is exceeded, the Terminal shall switch back to its previous "NAVIGATION SYSTEM TYPE." It is the responsibility of the Host Platform to insure that Dead Reckoning data provided to the Terminal is consistent with the value of the field NAVIGATION SYSTEM TYPE.

A.4.4.26 Initial entry message assignment inhibit (word #59)

The bits in this word indicate which Time Slot Assignments, defined in the received initial entry messages, are to be used upon passing all current validity checks.

Field VOICE A TIME SLOT INHIBIT (VATSI)

Identifier: AP073
Ref.: SS-JC-10002 Adaptable Parameter "Voice A PG assignments";
SS-JC-10002 3.2.1.1.1.6.6
Type: Boolean
Values: Logic 1 = Do not use Voice A Time Slots
Logic 0 = Use Voice A Time Slots
Default: 1
Comments:

A.4.4.27 Reserved

A.4.4.28 Time slot assignment blocks #1-64 (words #61-444)

Initialization Data Words 61 to 444 contain 64 Time Slot Assignment Blocks. (Initialization Data Words 3991 to 5910 contain 320 additional Time Slot Assignment Blocks for a total of

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

384. See Section A.4.4.97.) Each Time Slot Assignment Block is composed of six 16-bit words. When an initialization data change is made to a Time Slot Assignment Block, all six words must be submitted.

A Time Slot Assignment Block can be one of two types, indicated by the RS field in bit 14 of the first word:

- a. Non-Relay Time Slot Assignment Block

or

- b. Relay Time Slot Assignment Block

The composition of a Time Slot Assignment Block depends on its type. The format of each type of Time Slot Assignment Block is described in the following sections.

A.4.4.28.1 Non-relay time slot assignment block

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
I	0(*)	RS=0	CM	RECURRENCE RATE				NET NUMBER						SET		
II	T/R	INDEX NUMBER														
III	0(*)	0		ACCESS DESCRIPTION					NUMBER OF RECEPTIONS		0(*)					
IV	0(*)	RDS	RELAY NET NUMBER						RELAY DELAY, RECEIVE END-TO-END RELAY DELAY							
V	ORIGINAL TRANSMIT NET							PG INDEX NUMBER								
VI	0	TRANSEC CVLL							0	MSEC CVLL						

(*) Reserved for Terminal use.

Field RELAY INDICATOR (RS)

Identifier: AP075

Ref.: SS-JC-10002 Adaptable Parameter "Relay indicator";
SS-JC-10002 3.2.1.1.1.8.2

Type: Coded

Values:

Value	Meaning
-------	---------

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
0	Non-Relay Time Slot Assignment
1	Relay Time Slot Assignment

Default: 0

Comments: This field is used to switch layout for Time Slot Assignment blocks.
This bit must be set to Logic 0 for a Non-Relay Time Slot Assignment.

Field CRYPTO MODE (CM)

Identifier: AP076

Ref.: SS-JC-10002 Adaptable Parameter "Crypto mode";
SS-JC-10002 3.2.1.1.1.4.5 & 3.2.1.1.1.8.6.2.e.3

Type: Coded

Values:

Value	Meaning
0	Common Variable Mode
1	Partitioned Variable Mode

Default: 0

Comments: If the PG INDEX NUMBER field (AP087) is the same as the index number for either variable definition net selection PG (A.4.4.50), this variable may be replaced by the Original CryptoMode (AP493/494) as defined in SS-JC-10002 3.2.1.1.1.8.6.2.e.3 and section (A.4.4.50) of this *System/Segment Interface Control Document Appendix A*.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field RECURRENCE RATE

Identifier: AP077
Ref.: SS-JC-10002 Adaptable Parameter "Recurrence rate";
SS-JC-10002 3.2.1.1.1.8.2
Type: Unsigned Integer
Range: 2 to 15
(0,1 = Illegal)
Default: 2
Comments:

Field NET NUMBER

Identifier: AP078
Ref.: SS-JC-10002 Adaptable Parameter "Net number";
SS-JC-10002 3.2.1.1.1.4.6.6 & 3.2.1.1.1.8.2.c & 3.2.1.1.1.8.6.2.a
Type: Unsigned Integer
Range: 0 to 127
Default: 0
Comments: If the PG INDEX NUMBER field (AP087) is 9 (Control), 12 (Voice A), or 13 (Voice B), then the value 127 means "use channel net number" (AP281, AP280 or AP279 respectively), otherwise the value 127 is Illegal. If the PG INDEX NUMBER field is the same as an entry (AP152) in Net Selection By PG Words 1-8, A.4.4.41, then this field shall be consistent with all net number fields in all time slot assignment blocks belonging to this PG. Those fields include AP078, AP084, AP086, AP093, AP101 and AP103, as well as AP151. If AP151 equals 127, then the net number (AP078 or AP093) in the first paired PG relay assignment or non-relay time slot assignment for the PG shall be used for all net numbers, including the net number for the PG in the net selection status.[SS/ICS App A V1 11246]

Field SET

Identifier: AP079
Ref.: SS-JC-10002 Adaptable Parameter "Set";
SS-JC-10002 3.2.1.1.1.2.2.2, SS-JC-10002 3.2.1.1.1.8.2;
Type: Coded
Values:

Value	Meaning
0	No Statement (Delete Block)

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
1	Set A
2	Set B
3	Set C

Default: 0

Comments: Time slot Set for this Time Slot Assignment Block.
If SET is set to "0" all fields in Time Slot Assignment block are "don't care" for validity purpose.

Field TRANSMIT/RECEIVE INDICATOR (T/R)

Identifier: AP080

Ref.: SS-JC-10002 Adaptable Parameter "Transmit indicator"
SS-JC-10002 3.2.1.1.1.8.2.e & 3.2.1.1.1.8.6.2.b.1

Type: Coded

Values:

Value	Meaning
0	Receive Slot Assignment
1	Transmit Slot Assignment

Default: 0

Comments: A receive slot assignment shall be subject to net selection only when the PG INDEX NUMBER (AP087) is an entry in A.4.4.41 (AP152).[SS/ICS App A V1 11297]

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field INDEX NUMBER

Identifier: AP081
Ref.: SS-JC-10002 Adaptable Parameter "Index number";
SS-JC-10002 3.2.1.1.1.2.2.2, SS-JC-10002 3.2.1.1.1.8.2
Type: Unsigned Integer
Range: 0 to 32767
Default: 0
Comments:

Field ACCESS DESCRIPTION

Identifier: AP082
Ref.: SS-JC-10002 Adaptable Parameter "Access description";
SS-JC-10002 3.2.1.1.1.8.2.e
Type: Coded
Values:

Value	Meaning
0	Contention Access 1/48 sec
1	Contention Access 1/24 sec
2	Contention Access 3/48 sec
3	Contention Access 1/12 sec
4	Contention Access 3/24 sec
5	Contention Access 2/12 sec
6	Contention Access 3/12 sec
7	Contention Access 4/12 sec
8	Contention Access 6/12 sec
9	Contention Access 8/12 sec
10	Contention Access 12/12 sec
11	Contention Access 16/12 sec
12	Contention Access 20/12 sec
13	Contention Access 26/12 sec
14	Contention Access 32/12 sec
15	Contention Access 64/12 sec
16	Dedicated Access Mode
17	Time Slot Reallocation
18	TSR Initial Entry
19-63	Not Used

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Default: 16

Comments:

1. If the TRANSMIT/RECEIVE INDICATOR T/R field is 0 (Receive), this field must be set to 16 (Dedicated Access).
2. All transmit Time Slot Assignment Blocks with the same PG require the same Access Description, except for PGs that employ TSR as described below).
3. Transmit Time Slot Assignment Blocks for a PG that employs a TSR Pool can have a mixture of Access Description 16, 17, and 18 assignments (no more than three Access Description 17 blocks per PG and a limit of only one Access Description 18 block per PG).
4. If the PG INDEX NUMBER is 1, 2, 3, 12 or 13 then Access Descriptions 17 and 18 are Illegal.
5. A time slot assignment block with this field set to contention access, must be deleted before it is modified to be a time slot assignment block with this field set to dedicated.

Field NUMBER of RECEPTIONS (NR)

Identifier: AP548

Ref.: SS-JC-10002 Adaptable Parameter "Number of messages to receive";
SS-JC-10002 3.2.1.1.1.8.5.f

Type: Coded

Values:

Value	Meaning
0	Receive up to four arriving
1	Receive the first arriving
2	Receive up to two arriving
3	Receive up to three arriving

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Default: 0

Comments: Defines the number of messages the terminal will set to receive in accordance with adaptable parameters of the assignment. During the explicit block and in the time slot indicated by AP085, relay delay receive, the terminal will set to receive a number of messages as indicated except for PGs 2, 3, 12 and 13. For these PGs, the Link 16 Waveform will only attempt to receive one message. If the AP is set to a value other than 1 for slot assignments with PG 2, 3, 12 or 13, the Link 16 Waveform will overwrite the AP to a value of 1 and accept the assignments.

For a transmit assignment in common with receive assignment(s) or relay receive assignment(s) and share the same pseudorandom sequence, the number of receptions field (AP548 or AP549) must be the same.

For a paired slot relay assignment where the transmit portion in common with receive assignment(s) or the receive portion of other paired slot relay assignment(s) and share the same pseudorandom sequence, the number of receptions field (AP548 or AP549) must be the same.

Field RELAY DELAY SWITCH (RDS)

Identifier: AP083

Ref.: SS-JC-10002 Adaptable Parameter "Relay delay switch (RDS)"
SS-JC-10002 3.2.1.1.1.4.5 & 3.2.1.1.1.8.2.a.2

Type: Coded

Values:

Value	Meaning
0	Bits 0-6 of this word contain the Relay Delay, Receive field
1	Bits 0-6 of this word contain the End-to-End Relay Delay field

Default: 0

Comments: RDS = 1 is valid only when the TRANSMIT/RECEIVE INDICATOR (T/R) field is 0 (Receive) and the CRYPTO MODE field is 1 for Partitioned Variable Mode (PVM).

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field RELAY NET NUMBER

Identifier: AP084

Ref.: SS-JC-10002 Adaptable Parameter "Relay net number"
SS-JC-10002 3.2.1.1.1.8.2.c & 3.2.1.1.1.8.5.b & 3.2.1.1.1.8.6.2

Type: Unsigned Integer

Range: 0 to 127

Default: 0

Comments: When the RDS field is 0 and the RELAY DELAY, RECEIVE field is 0, this field is not used.

When the RDS field is 0 and the RELAY DELAY, RECEIVE field is 6 to 31 the RELAY NET NUMBER is used as follows:

- 127 is illegal unless it is a voice A, voice B or Control,
- if Voice A, Voice B or Control and the Net is 127, use AP279, AP280 or AP281 appropriately.

If the PG INDEX NUMBER field (AP087) is the same as an entry (AP152) in Net Selection By PG Words 1-8, A.4.4.41, then this field shall be consistent with all net number fields in all time slot assignment blocks belonging to this PG. Those fields include AP078, AP084, AP086, AP093, AP101 and AP103, as well as AP151. If AP151 equals 127, then the net number (AP078 or AP093) in the first paired PG relay assignment or non-relay time slot assignment for the PG shall be used for all net numbers, including the net number for the PG in the net selection status.[SS/ICS App A V1 53590]

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field RELAY DELAY, RECEIVE / END-TO-END RELAY DELAY

Identifier: AP085
Ref.: SS-JC-10002 Adaptable Parameter "Relay delay"
SS-JC-10002 3.2.1.1.1.4.5, 3.2.1.1.1.8.2.a.2 & 3.2.1.1.1.8.5.b
Type: Unsigned Integer
Range/Units: 6 to 127 slots
Default: 6
Comments: When the RDS field is 0, this field contains the Relay Delay, Receive
0 = No Statement
1 to 5 = Illegal
6 to 31 = Assigned Number of Delay Slots
32 to 127 = Illegal.
When the RDS field is 1, this field contains the End-to-End Relay Delay
0 to 5 = Illegal
6 to 127 = Assigned Number of Delay Slots.

Field ORIGINAL TRANSMIT NET

Identifier: AP086
Ref.: SS-JC-10002 Adaptable Parameter "Original transmit net"
SS-JC-10002 3.2.1.1.1.4.5 & 3.2.1.1.1.8.6.2.a
Type: Unsigned Integer
Range: 0 to 127
Default: 0
Comments: Valid only when the RDS field is 1.
If the PG INDEX NUMBER field (AP087) is 9 (Control), 12 (Voice A), or 13 (Voice B) then the value 127 means "use channel Net Number" (AP281, AP280 or AP279 respectively), otherwise the value 127 is Illegal.
If the PG INDEX NUMBER field is the same as an entry (AP152) in Net Selection By PG Words 1-8, A.4.4.41, then this field shall be consistent with all net number fields in all time slot assignment blocks belonging to this PG. Those fields include AP078, AP084, AP086, AP093, AP101 and AP103, as well as AP151. If AP151 equals 127, then the net number (AP078 or AP093) in the first paired PG relay assignment or non-relay time slot assignment for the PG shall be used for all net numbers, including the net number for the PG in the net selection status.[SS/ICS App A V1 53591]

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field PG INDEX NUMBER

Identifier: AP087
Ref.: SS-JC-10002 Adaptable Parameter "PG index number";
SS-JC-10002 3.2.1.1.1.8.2.b & d
Type: Unsigned Integer
Range: 0 to 511
(0 = No Statement)
Default: 0
Comments:

Field TRANSEC CVLL

Identifier: AP088
Ref.: SS-JC-10002 Adaptable Parameter "TRANSEC CVLL";
SS-JC-10002 3.2.1.1.1.4.6.4 & 3.2.1.1.1.8.2.c & 3.2.1.1.1.8.6.2.f.1(a-c) &
3.2.1.1.1.8.6.2.c
Type: Unsigned Integer
Range: 0 to 127
(0 = Illegal)
Default: 1
Comments: Transmission Security Variable Label.
If the PG INDEX NUMBER field (AP087) is the same as the index number for either variable definition net selection PG (A.4.4.50), this variable may be replaced by a CVLL (AP492) as defined in SS-JC-10002 3.2.1.1.1.8.6.2.f.1 (a-c) & 3.2.1.1.1.8.6.2.c and section (A.4.4.50) of this System/Segment Interface Control Document Appendix A.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field MSEC CVLL

Identifier: AP089

Ref.: SS-JC-10002 Adaptable Parameter "MSEC CVLL";
SS-JC-10002 3.2.1.1.1.4.6.4 & 3.2.1.1.1.8.6.2.f.1 (a-c) & 3.2.1.1.1.8.6.2.c

Type: Unsigned Integer

Range: 0 to 127
(0 = No Statement)

Default: 1

Comments: Message Security (MSEC) Variable Label.
When the CRYPTO MODE (CM) field is 0 for Common Variable Mode (CVM), MSEC CVLL must equal TRANSEC CVLL.
When the CRYPTO MODE (CM) field is 1 (PVM) and the PG INDEX NUMBER is 9, 12, or 13 the Terminal does not check input MSEC CVLL variables.
If the PG INDEX NUMBER field (AP087) is the same as the index number for either variable definition net selection PG (A.4.4.50) this variable may be replaced by a CVLL (AP492) as defined in SS-JC-10002 3.2.1.1.1.8.6.2.f.1 (a-c) & 3.2.1.1.1.8.6.2.c and section (A.4.4.50) of this *System/Segment Interface Control Document Appendix A*.

Field RELAY INDICATOR (RS)

Identifier: AP075

Ref.: SS-JC-10002 Adaptable Parameter "Relay indicator"
SS-JC-10002 3.2.1.1.1.8.2

Type: Coded

Values:

Value	Meaning
0	Non-Relay Time Slot Assignment
1	Relay Time Slot Assignment

Default: 0

Comments: This field is used to switch layout for Time Slot Assignment blocks.
This bit must be set to Logic 1 for a Relay Time Slot Assignment.

Field CRYPTO MODE (CM)

Identifier: AP091

Ref.: SS-JC-10002 Adaptable Parameter "Crypto mode";
SS-JC-10002 3.2.1.1.1.4.5 & 3.2.1.1.1.8.6.2.e.3

Type: Coded

Values:

Value	Meaning
0	Common Variable Mode
1	Partitioned Variable Mode

Default: N/A since RS field default value is 0

Comments: If the PG INDEX NUMBER field (AP104) is the same as the index number for either variable definition net selection PG (A.4.4.50), this variable may be replaced by the Original CryptoMode (AP493/494) as defined in SS-JC-10002 3.2.1.1.1.8.6.2.e and section (A.4.4.50) of this *System/Segment Interface Control Document Appendix A*.

Field RECURRENCE RATE

Identifier: AP092
Ref.: SS-JC-10002 Adaptable Parameter "Recurrence rate";
SS-JC-10002 3.2.1.1.1.8.2
Type: Unsigned Integer
Range: 2 to 15
(0,1 = Illegal)
Default: N/A since RS field default value is 0
Comments:

Field NET NUMBER (RECEIVE)

Identifier: AP093
Ref.: SS-JC-10002 Adaptable Parameter "Net number (receive)";
SS-JC-10002 3.2.1.1.1.4.6.6 & 3.2.1.1.1.8.2.c & 3.2.1.1.1.8.6.2.a
Type: Unsigned Integer
Range: 0 to 127
(127 = No Statement)
Default: N/A since RS field default value is 0
Comments: Defines the receive net number to be used for this Time Slot Assignment Block. If the PG INDEX NUMBER field (AP104) is 9 (Control), 12 (Voice A), or 13 (Voice B) then the value 127 means "use channel Net Number" (AP281, AP280 or AP279 respectively), otherwise the value 127 is illegal.
If the PG INDEX NUMBER field is the same as an entry (AP152) in Net Selection By PG Words 1-8, A.4.4.41, then this field shall be consistent with all net number fields in all time slot assignment blocks belonging to this PG. Those fields include AP078, AP084, AP086, AP093, AP101 and AP103, as well as AP151. If AP151 equals 127, then the net number (AP078 or AP093) in the first paired PG relay assignment or non-relay time slot assignment for the PG shall be used for all net numbers, including the net number for the PG in the net selection status.[SS/ICS App A V1 53594]

FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field INDEX NUMBER

Identifier: AP096
Ref.: SS-JC-10002 Adaptable Parameter "Index number";
SS-JC-10002 3.2.1.1.1.2.2.2, SS-JC-10002 3.2.1.1.1.8.2
Type: Unsigned Integer
Range: 0 to 32767
Default: N/A since RS field default value is 0
Comments:

Field RELAY DELAY

Identifier: AP097
Ref.: SS-JC-10002 Adaptable Parameter "Relay delay";
SS-JC-10002 3.2.1.1.1.8.2.a.2
Type: Unsigned Integer
Range/Units: 6 to 31 slots
(0 to 5 = Illegal)
Default: N/A since RS field default value is 0
Comments: The number of delay slots between reception and transmission.

Field RELAY FUNCTION

Identifier: AP098
Ref.: SS-JC-10002 Adaptable Parameter "Relay function";
SS-JC-10002 3.2.1.1.1.8.4.3.2 to 3.2.1.1.1.8.4.4.5
Type: Coded
Values:

Value	Meaning
0	Main Net Relay
1	Voice Net Relay
2	Control Net Relay
3	Zoom Relay
4	Directed Relay
5	Message Directed MDR=0
6	Message Directed MDR=1
7	Participation Group Relay

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Default: N/A since RS field default value is 0

Comments:

Field RELAY CONTROL (RC)

Identifier: AP099

Ref.: SS-JC-10002 Adaptable Parameter "Relay control";
SS-JC-10002 3.2.1.1.1.8.2.e & 3.2.1.1.1.8.4

Type: Coded

Values:

Value	Meaning
0	No Statement
1	Suspended
2	Conditional
3	Unconditional

Default: N/A since RS field default value is 0

Comments: A "Suspended" relay is inactive for both receive and transmit. The Terminal will receive on the default net using the default cryptovars for suspended relay receive and relay transmit slots (AP037 DEFAULT NET NUMBER and AP038 DEFAULT TRANSEC) if there are no other slot assignments overlapping with the suspended relay assignment for that time slot. If there are other slot assignments that overlap with the suspended relay assignment, then the Terminal will receive data only from the overlapping slots for that time slot. "Conditional" and "Unconditional" refer to transmit operation only. Relay Inhibit (AP355) affects only message transmission, that is all transmission and retransmission in all relay modes. Receive functions are unaffected and in accordance with parameters in the Relay Time Slot Assignment Blocks.

Field NUMBER of RECEPTIONS (NR)

Identifier: AP549

Ref.: SS-JC-10002 Adaptable Parameter "Number of messages to receive";
SS-JC-10002 3.2.1.1.1.8.5.f

Type: Coded

Values:

Value	Meaning
-------	---------

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
0	Receive up to four arriving
1	Receive the first arriving
2	Receive up to two arriving
3	Receive up to three arriving

Default: 0

Comments: Defines the number of messages the terminal will set to receive in accordance with adaptable parameters of the assignment. During the explicit relay receive time slot block the terminal will set to receive a number of messages as indicated. When not relay transmitting the terminal will set to receive a number of messages as indicated except for PGs 12 and 13 (voice relay). For these PGs, the Link 16 Waveform will only attempt to receive one message. If the AP is set to a value other than 1 for PGs 12 or 13, the Link 16 Waveform will overwrite this to a 1.

For a transmit assignment in common with receive assignment(s) or relay receive assignment(s) and share the same pseudorandom sequence, the number of receptions field (AP548 or AP549) must be the same.

For a paired slot relay assignment where the transmit portion in common with receive assignment(s) or the receive portion of other paired slot relay assignment(s) and share the same pseudorandom sequence, the number of receptions field (AP548 or AP549) must be the same.

Field DO NOT DECRYPT (DND)

Identifier: AP100

Ref.: SS-JC-10002 Adaptable Parameter "Do not decrypt";
SS-JC-10002 3.2.1.1.1.4.6

Type: Boolean

Values: Logic 1 = Do not attempt to decrypt relayed messages
Logic 0 = Attempt to decrypt relayed messages

Default: N/A since RS field default value is 0

Comments: Valid only when the CRYPTO MODE (CM) field is 1 (PVM).

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field ORIGINAL TRANSMIT NET

Identifier: AP101
Ref.: SS-JC-10002 Adaptable Parameter "Original transmit net"
SS-JC-10002 3.2.1.1.1.4.5 & 3.2.1.1.1.8.6.2.a
Type: Unsigned Integer
Range: 0 to 127
Default: N/A since RS field default value is 0
Comments: Valid only when the CRYPTO MODE (CM) field is 1 (PVM). If the PG INDEX NUMBER field (AP104) is 9 (Control), 12 (Voice A), or 13 (Voice B) then the value 127 means "use channel Net Number" (AP281, AP280 or AP279 respectively), otherwise the value 127 is illegal.
If the PG INDEX NUMBER field is the same as an entry (AP152) in Net Selection By PG Words 1-8, A.4.4.41 , then this field shall be consistent with all net number fields in all time slot assignment blocks belonging to this PG. Those fields include AP078, AP084, AP086, AP093, AP101 and AP103, as well as AP151. If AP151 equals 127, then the net number (AP078 or AP093) in the first paired PG relay assignment or non-relay time slot assignment for the PG shall be used for all net numbers, including the net number for the PG in the net selection status.[SS/ICS App A V1 53595]

Field END-TO-END RELAY DELAY

Identifier: AP102
Ref.: SS-JC-10002 Adaptable Parameter "End-to-end delay"
SS-JC-10002 3.2.1.1.1.4.5
Type: Unsigned Integer
Range/Units: 0 slot = legal
1 to 5 = illegal
6 to 127 slots = legal
Default: N/A
Comments: Valid only when the CRYPTO MODE (CM) field is 1 (PVM).

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field NET NUMBER (TRANSMIT)

Identifier: AP103
Ref.: SS-JC-10002 Adaptable Parameter "Net number (transmit)"
SS-JC-10002 3.2.1.1.1.4.6.6 & 3.2.1.1.1.8.2.c & 3.2.1.1.1.8.6.2.a
Type: Unsigned Integer
Range: 0 to 127
Default: N/A since RS field default value is 0
Comments: Defines the transmit net number to be used for this Time Slot Assignment Block. If the PG INDEX NUMBER field (AP104) is 9 (Control), 12 (Voice A), or 13 (Voice B) then the value 127 means "use the channel Net Number" (AP279, AP280, AP281), otherwise the value 127 is Illegal.
If the PG INDEX NUMBER field is the same as an entry (AP152) in Net Selection By PG Words 1-8, A.4.4.41, then this field shall be consistent with all net number fields in all time slot assignment blocks belonging to this PG. Those fields include AP078, AP084, AP086, AP093, AP101 and AP103, as well as AP151. If AP151 equals 127, then the net number (AP078 or AP093) in the first paired PG relay assignment or non-relay time slot assignment for the PG shall be used for all net numbers, including the net number for the PG in the net selection status.[SS/ICS App A V1 53596]

Field PG INDEX NUMBER

Identifier: AP104
Ref.: SS-JC-10002 Adaptable Parameter "PG index number";
SS-JC-10002 3.2.1.1.1.8.2.b & d
Type: Unsigned Integer
Range: 0 to 511
(0 = No Statement)
Default: N/A since RS field default value is 0
Comments: The entry in this field depends on the RELAY FUNCTION selected in Time Slot Assignment Block word III as follows:

RELAY FUNCTION	PG INDEX NUMBER
0	0 - 511
1	12 for Voice A 13 for Voice B
2	9
3	0 - 511

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

RELAY FUNCTION	PG INDEX NUMBER
4	Applicable Group Number (0 - 63)
5	0 - 511
6	0 - 511
7	4-8, 10, 11, 14-511 (1)

⁽¹⁾ PG values 9, 12 and 13 not a mandatory requirement for this relay function.

Field TRANSEC CVLL

Identifier: AP105

Ref.: SS-JC-10002 Adaptable Parameter "TRANSEC CVLL";
SS-JC-10002 3.2.1.1.1.4.6.4 & 3.2.1.1.1.8.2.c & 3.2.1.1.1.8.6.2.f.1 (a-c) &
3.2.1.1.1.8.6.2.c

Type: Unsigned Integer

Range: 0 to 127
(0 = Illegal)

Default: N/A since RS field default value is 0

Comments: Transmission Security Variable Label.

If the PG INDEX NUMBER field (AP104) is the same as the index number for either variable definition net selection PG (A.4.4.50), this variable may be replaced by a CVLL (AP492) as defined in SS-JC-10002 3.2.1.1.1.8.6.2.f.1 (a-c), 3.2.1.1.1.8.6.2.c and section (A.4.4.50) of this *System/Segment Interface Control Document Appendix A*.

Field MSEC CVLL

Identifier: AP106

Ref.: SS-JC-10002 Adaptable Parameter "MSEC CVLL";
SS-JC-10002 3.2.1.1.1.4.6.4 & 3.2.1.1.1.8.2.c & 3.2.1.1.1.8.6.2.f.1 (a-c) &
3.2.1.1.1.8.6.2.c

Type: Unsigned Integer

Range: 0 to 127
(0 = No Statement)

Default: N/A since RS field default value is 0

Comments: Message Security Variable Label.
When the CRYPTO MODE (CM) field is 0 and the CRYPTO NET RELAY (CNR) field is 0, MSEC CVLL must equal TRANSEC CVLL.
When the CRYPTO MODE (CM) field is 0 and the CRYPTO NET RELAY (CNR) field is 1, MSEC CVLL = 0 is Illegal.
When the CRYPTO MODE (CM) field is 1 and DO NOT DECRYPT (DND) field is 0, MSEC CVLL = 0 is Illegal.
When the CRYPTO MODE (CM) field is 1 and DO NOT DECRYPT (DND) field is 1, MSEC CVLL is a "don't care."
If the PG INDEX NUMBER field (AP104) is the same as the index number for either variable definition net selection PG (A.4.4.50) this variable may be replaced by a CVLL (AP492) as defined in SS-JC-10002 3.2.1.1.1.8.6.2.f.1 (a-c), 3.2.1.1.1.8.6.2.c and section (A.4.4.50) of this *System/Segment Interface Control Document Appendix A*.

A.4.4.29 Time slot reallocation pools #0-7 (words #447-478)

Each of the eight TSR Pools, numbered from 0 to 7, contain four words of control data. The correspondence between a Time Slot Reallocation Pool and its number is implicit, based on the position of the four pool definition words in the Initialization Data Words 447 to 478.

During Initialization Data Load, the DATA CHANGE VALIDITY (DCV) bit will be ignored by the Terminal. During validity checking, all the TSR pools will be validity checked. Validity checking will be performed starting on the lowest numbered pool. If pool data is found to be invalid, and the OPERATE/SUSPEND (OS) bit for the pool was set to "Operate," it shall be set to "Suspend" and a Data Conflict flagged. If the OS bit for a pool is set to "Operate" and two previously validated pools are already set to "Operate," the OS bit shall be set to "Suspend" and a Data Conflict flagged.[SS/ICS App A V1 11845]

When an initialization data change is made to a TSR Pool, all four words must be submitted. If a data change specifies the OPERATE/SUSPEND (OS) field as "Operate" for one pool while the

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Terminal is already active on two other pools, the Terminal shall ignore the operate request for the new pool and shall issue a data conflict. If a data change specifies the OPERATE/SUSPEND (OS) field as "Operate" for a pool that is not already active and the Terminal is not active on two other pools at that time, the Terminal shall perform validity checking on that pool using all current initialization data. The Terminal shall also perform validity checking on a pool if it is "Suspended" whenever a change related to that pool is received.[SS/ICS App A V1 11846]

If the Host wants to change operation from one pool to another, the Host must input two data changes: one to suspend the first pool and the other to operate on the second pool.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word

III	PREDICTED NUMBER OF MESSAGES										PREDICTED AVERAGE NUMBER OF WORDS					
IV	0						PG INDEX NUMBER									

Field DATA CHANGE VALIDITY (DCV)

Identifier: AP107

Ref.: SS-JC-10002 Adaptable Parameter "Data change validity (DCV) for pools 0-7";
SS-JC-10002 3.2.1.1.1.11.2.1

Type: Boolean

Values: Logic 1 = Data Change Valid
Logic 0 = Data Change Not Valid

Default: 0

Comments: This bit is used for initialization data changes to indicate the validity of the fields in the TSR Pool. The OPERATE/SUSPEND (OS) field is always valid. The validity of the other fields is as follows:

1. If the Terminal was already "Active" on the pool prior to the data change, this bit determines the validity of TSR Pool word III. The Terminal will always ignore bits 0 to 13 of word I, all of word II and word IV.
2. If the Terminal was suspended or "Inactive" on the pool prior to the data change, this bit applies to the data in all four words.

SS-JC-10002 3.2.1.1.1.8.3.3.8.b & 3.2.1.1.1.8.3.3.9.b
Type: Unsigned Integer
Range: 0 to 127
Default: 0
Comments: MSEC Cryptovisible Logical Label for Net N+1.
Note: When the Voice A, Voice B, or Control PGs are used in Partitioned Variable Mode, the previous words (VARIABLE CONTROL WORDS and CRYPTOVARIBLE LOGICAL LABEL DEFINITION WORDS) are used to define the MSEC CVLLs for the different channels that are part of the PG. Among the three PGs, a total of 192 channels (net numbers) can be given an MSEC CVLL in the following manner:

1. The first K MSEC CVLLs are assigned to K channels of the Voice A PG, starting with a net number defined by AP123 VOICE GROUP A STARTING NET, and proceeding sequentially through K consecutive net numbers.
2. The next L MSEC CVLLs are assigned to channels of the Voice B PG, using the starting net number defined by AP125 VOICE GROUP B STARTING NET.
3. The final M MSEC CVLLs are assigned to the control PG using the starting net number defined by AP127 CONTROL GROUP STARTING NET.
4. K, L, and M must obey the following condition:
K+L+M cannot exceed 192.

If there is a separate time slot block assignment for a particular channel (SS-JC-10002 paragraph 3.2.1.1.1.8.3.3.8.b and SS-JC-10002 paragraph 3.2.1.1.1.8.3.3.9.b), the MSEC specified in the time slot block assignment takes precedence over the MSEC determined by the fields shown in this section. For stacked net, i.e. when the net number field in the time slot assignment block is 127, the MSEC specified in this table takes precedence over the MSEC specified in the time slot assignment block.

A.4.4.35 Recording function words (words #590-642)

The recording function provides a way for the Terminal to sent recording information to a tape recorder device connected either to the support port or the host data bus. The type of data that can be recorded are FIMs, FOMs, and Status information.

The recorder function is activated by the adaptable parameter AP013, RECORDER FUNCTION ON. The adaptable parameter AP024, TAPE RECORDER PORT SELECTION, selects the destination port.

Section A.4.4.35.1 defines the control data needed to record FIMs and FOMs exchanged between the host and the Terminal through the host data bus.

Section A.4.4.35.2 below, specifies the control data needed to perform periodic recording of status data. For one-time recording of status data, the host can perform an Initialization & Status

UNCLASSIFIED

ICS-JC-10002 Rev -
Appendix A

Data Request, by sending the corresponding FIM02 (see section A.7.1.2 of Volume II) and record the response by setting the appropriate recording filters, as defined in A.4.4.35.1.

As said, the information selected as to be recorded is sent to the destination port, as indicated by AP024, TAPE RECORDER PORT SELECTION. The Terminal can record up to 200 16-bit words. The recording data is issued up to a maximum of 1000 16-bit words every 5 slots through the support port, and IAW the BOM size and rate through the host data bus, up to a maximum of 200 16-bit words every time slot (see A.9 of Volume III and the following chapters).

Each port has a buffer to store recording data. These buffers are 2048 16 bit-words for the support port, and 1200 16 bit-words for the host data bus. In the case of overflow of the buffers, it will be flagged in the Ongoing BIT and Status FOM, FOM03 (see A.7.2.3 of Volume II), and the most recent Recording Data to be sent to be recorder device will be discarded.

A.4.4.35.1 Recorder function words 1-8 (words #590-600)

Field FIMxx

Identifier: AP275
Ref.: SS-JC-10002 Adaptable Parameter "FIMs 01..64 recording ON/OFF"; SS-JC-10002 3.2.5.2.7
Type: Boolean
Values: Logic 0 = FIM recording off
Logic 1 = FIM recording on
Default: 0
Comments: Selection of FIMs not defined in A.7.1 of Volume II will result in no action performed.

Field FOMxx

Identifier: AP276
Ref.: SS-JC-10002 Adaptable Parameter "FOMs 01..64 recording ON/OFF"; SS-JC-10002 3.2.5.2.7
Type: Boolean
Values: Logic 0 = FOM recording off
Logic 1 = FOM recording on
Default: 0
Comments: Selection of FOMs not defined in A.7.2 of Volume II will result in no action performed.

A.4.4.35.1.1 Reserved (words #596-600)

A.4.4.35.2 Status data recording selection words 1-2 (words #601-604)

The Terminal can record up to two Status Data segments. These segments are specified by two filters, each of which is defined by the following couple of words:

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
I	DATA WORD COUNT					STARTING DATA WORD										
II	0	RECORDING RATE														

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field STARTING DATA WORD

Identifier: AP315
Ref.: SS-JC-10002 Adaptable Parameter "Status data recording starting data words 1 & 2"; SS-JC-10002 3.2.5.2.7
Type: Unsigned Integer
Range: 1 to 2047
Default: 1
Comments: Defines the first word of a segment of the status data file that has to be recorded.

Field DATA WORD COUNT

Identifier: AP388
Ref.: SS-JC-10002 Adaptable Parameter "Status recording data word counts 1 & 2"; SS-JC-10002 3.2.5.2.7.a
Type: Unsigned Integer
Range: 1 to 30
Default: 1
Comments: It is the number of contiguous words of the status data file that has to be recorded, including the starting data word (AP315).

Field RECORDING RATE

Identifier: AP316
Ref.: SS-JC-10002 Adaptable Parameter "Recording rates 1 & 2"; SS-JC-10002 3.2.5.2.7
Type: Unsigned Integer
Range/Units: 0 to 32767 number of slots
0 = do not output
Default: 0
Comments: Specifies the rate at which the recorded data are to be reported to the host. A value of 'N' means Record status data every Nth time slot.

Field SPECIAL SECONDARY TRACK NUMBER (SSTN)

Identifier: AP442
Ref.: SS-JC-10002 Adaptable Parameter "Special secondary source track numbers";
SS-JC-10002 3.2.1.1.1.14.2 & 3.2.1.1.1.14.8
Type: Bit-mapped array (Boolean)
Values: Logic 1 = Use special secondary track number
Logic 0 = Do not use special secondary track number
Default: 0
Comments: The Terminal shall provide addressed message processing, in accordance with the referenced SS-JC-10002 paragraphs, for each of the selected special secondary track numbers. Their table entries, above, are octal. Note that addresses 0₈, 77₈ and 177₈ are invalid for use as SSTNs.

A.4.4.40 Transmit PG related data blocks 1-32 (words #841-1000), ET code rates (words #1001-1008), and transmit slots reporting PG 1-10 (words #1011-1020)

A.4.4.40.1 Transmit PG related data blocks 1-32 (words #841-1000)

These blocks define data related to PGs for which the MIDS JTRS holds a transmit time slot assignment block (up to 32 PGs).

All 32 blocks shall have the same following structure:

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
I	POWER SELECT		0	PACKING LIMIT		PG INDEX NUMBER

Word																
IV	*Res		STALENESS LIMIT													
V	RESERVED															

*Note: Bits 14 and 15 of word IV are reserved for Terminal use (LVT2) and should be set to zero by the MIDS JTRS Host.

Field POWER SELECT

Identifier: AP137

Ref.: SS-JC-10002 Adaptable Parameter "PG power selection";
SS-JC-10002 3.2.1.1.1.3.7.4

Type: Coded

Values:

Value	Meaning
0	Normal Power
1	Low Power
2	Medium Power
3	High Power (HPA)
4	Low Power (HPA)
5-7	Not Used

Default: 0

Comments: Transmission Power Selection for associated PG Index Number. When the AP011 OUTPUT POWER MODE is set to "Mixed Power," this field defines the output power for each of the PGs for which the MIDS JTRS holds a transmit time slot assignment block (up to 32 PGs).

This field is valid both for needline and non needline PGs.

Field PACKING LIMIT

Identifier: AP138

Ref.: SS-JC-10002 Adaptable Parameter "Packing limit";
SS-JC-10002 3.2.1.1.1.15.6.2

Type: Coded

Values:

A-250

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -

Value	Meaning
0	No Statement
1	Standard Message Only
2	Standard or Packed-2 DP
3	Standard or Packed-2 SP
4	Standard, Packed-2 DP, Packed-2 SP, or Packed-4
5-7	Not Used

Default: 1 (Standard Message Only)

Comments: The Default Packing Limit that the Terminal shall use for the messages to be transmitted on the designated PG or Needline PG when none is specified by the Host for the message.

When PACKING LIMIT is No Statement, the Terminal takes the Terminal default packing limit defined as an SS-JC-10002 variable parameter.

This field is valid both for needline and non needline PGs.

Field PG INDEX NUMBER

Identifier: AP139

Ref.: SS-JC-10002 Adaptable Parameter "PG index number";
SS-JC-10002 3.2.1.1.1.8.3.3.1.a

Type: Unsigned Integer

Range: 0 to 511
(0 = No Statement)

Default: 0

Comments: PG associated with the block.

This field is valid both for needline and non needline PGs.

Field TRANSMIT ANTENNA

Identifier: AP140

Ref.: SS-JC-10002 Adaptable Parameter "Transmit Antenna";
SS-JC-10002 3.2.1.1.1.21.1.a

Type: Coded

Values:

Value	Meaning
-------	---------

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
0	Transmit on both antennas
1	Transmit on antenna A only
2	Transmit on antenna B only
3-7	Not used

Default: 1

Comments: Valid only when GLOBAL TRANSMIT ANTENNA adaptable parameter set to "Mixed."

This field contains the selection of which antenna ports are to be used for transmission on the given PG (PG INDEX NUMBER field).

This field is valid both for needline and non needline PGs.

Field IJMS/LINK 16 SELECT (I/J)

Identifier: AP141

Ref.: SS-JC-10002 Adaptable Parameter "IJMS/Link 16 select (I/J) for 32 transmit PGs"; SS-JC-10002 3.2.1.1.1.20.2.2.1

Type: Coded

Values:

Value	Meaning
0	Not Used
1	Transmit Link 16 Only
2	Reserved
3	Reserved

Default: 1

Comments: Transmission format the Terminal shall use for the message in FIM01 if the Interim JTIDS Message Specification (IJMS)/LINK 16 SELECT field in FIM01 is set to "No Statement."

This field is valid both for needline and non needline PGs.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field AUTOMATIC J0.5 MESSAGE GENERATION (AJ)

Identifier: AP136

Ref.: SS-JC-10002 Adaptable Parameter "Automatic J0.5 message generation per PG";
SS-JC-10002 3.2.1.1.1.9.2.1

Type: Coded

Values:

Value	Meaning
0	No Automatic J0.5 Message Generation for this PG
1	Automatic J0.5 Message Generation for this PG

Default: 0

Comments: This field specifies automatic J0.5 message generation for up to 31 PGs for which the MIDS JTRS holds a transmit time slot assignment block. None of the 31 PGs can be the Initial Entry PG.

This field is valid only for non needline PGs.

Field STORAGE LIMIT

Identifier: AP143

Ref.: SS-JC-10002 Adaptable Parameter "Message transfer storage limit";
SS-JC-10002 3.2.1.1.1.20.3.3

Type: Unsigned Integer

Range: 0 to 280
(0 = No Statement)

Default: 0

Comments: This field defines the maximum number of transfers from the Host that can be stored for up to 10 PGs for which the MIDS JTRS holds a transmit time slot assignment block (up to 32 PGs).

The Host shall set STORAGE LIMIT to No Statement for all PGs for which no individual flow control is demanded.

The sum of all storage limits specified by the Host shall not exceed 280.

This field is valid both for needline and non needline PGs.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field PRIORITY

Identifier: AP144
 Ref.: SS-JC-10002 Adaptable Parameter "Priorities for 32 transmit needlines"; SS-JC-10002 3.2.1.1.1.8.3.3.11.3.a & 3.2.1.1.1.15.5
 Type: Unsigned Integer
 Range: 0 to 15
 (0 = No Statement)
 (1 = Highest Priority)
 (15 = Lowest Priority)
 Default: 0
 Comments: Defines the default precedence of transmission for messages if none is specified by the Host for a given message. If this field is set to No Statement then the Terminal uses the lowest priority.
 This field is valid both for needline and non-needline PGs.

Field STALENESS LIMIT

Identifier: AP090
 Ref.: SS-JC-10002 Adaptable Parameter "Staleness default",
 SS-JC-10002 3.2.1.1.1.8.3.3.11.3.a
 Type: Unsigned Integer
 Range/Units: 1 to 16383 time slots
 Default: 1536 (12 seconds)
 Comments: Refers to the age at which the message will be deleted if not transmitted. The age is calculated by the Terminal as the amount of time since it received the message
 This field is valid for needline and non-needline PGs.

A.4.4.40.2 Enhanced throughput code rates for transmit PG blocks 1-32 (words #1001-1008)

Field ENHANCED THROUGHPUT CODE RATE LIMIT (CRL), BLOCK N (N = 1 to 32)

Identifier: AP605

Ref.: SS-JC-10002 Adaptable Parameter "Enhanced throughput code rate limit for 32 transmit PGs";
SS-JC-10002 3.2.1.1.1.15.6.2

Type: Coded

Values:

Value	Meaning
0	No statement
1	Convolutional code rate = 1/3
2	Convolutional code rate = 1/2
3	Convolutional code rate = 3/4
4	Convolutional code rate = 7/8
5	No convolutional encoding
6-7	Not used

Default: 0 (No statement)

Comments: This field shall apply only to messages that are transferred to the Terminal using FIM60: Enhanced Throughput FIM.

This field designates the maximum code rate that may be used by the Terminal for an enhanced throughput message in this PG, unless overridden by the MAXIMUM CODE RATE field in FIM60: Enhanced Throughput FIM. When this field is set to 0 (no statement) and the MAXIMUM CODE RATE field in FIM60 is also set to 0 (no statement), then the code rate limit for the message shall be determined from the Terminal default code rate limit variable parameter, whose default value is rate = 1/3 (value 1). As the code rate varies from 1/3 to 1 (values 1 to 5), communication performance decreases, but the amount of information that can be contained in a time slot increases. Convolutional code rate = 1/3 provides the best performance (lowest probability of message errors);

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -

1020	SPARE								TRANSMIT SLOTS REPORTING PG10							

Field TRANSMIT SLOTS REPORTING PG n (values of 'n' are 1 to 10)

Identifier: AP438
 Ref.: SS-JC-10002 Adaptable Parameter "10 PGs for transmit slot availability outputs";
 SS-JC-10002 3.2.1.1.8.1
 Type: Unsigned Integer
 Values: 0 to 511
 (0 = No Statement)
 Comments: The Participation Groups the Terminal shall use to monitor the total number of transmit slots available in a six second period in each participation group.

A.4.4.41 Net selection by PG words 1-8 (words #1021-1028)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
N	NET NUMBER								PG INDEX NUMBER							

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field NET NUMBER

Identifier: AP151

Ref.: SS-JC-10002 Adaptable Parameter "Net selection status";
SS-JC-10002 3.2.1.1.1.8.6.2.a

Type: Unsigned Integer

Range: 0 to 127

Default: 127

Comments: Net Number selection for associated PG Index Number.
Value 127 indicates that the Terminal is not initialized with any non-relay time slot assignments or paired PG slot relay assignments for the associated PG.
The Terminal shall reject any host provided change to the "Net selection status" table (AP151) when it is in an operational state (i.e. CURRENT INITIALIZATION STATE set to "Load Complete, Validity Test in Progress", "Load Complete, Valid Data" or "Load Complete, Data Conflict").[SS/ICS App A V1 13431]
Change to the "Net selection status" table (AP151) can be made using only AP366 and AP365 when the Terminal is in an operational state (i.e. CURRENT INITIALIZATION STATE set to "Load Complete, Validity Test in progress", "Load Complete, Valid Data" or "Load Complete, Data Conflict").

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field PG INDEX NUMBER

Identifier: AP152

Ref.: SS-JC-10002 Adaptable Parameter "Net selection status"
SS-JC-10002 3.2.1.1.1.4.6.6

Type: Unsigned Integer

Range: 0,4 to 511 except 9, 12, and 13
(0 = No Statement)

Default: 0

Comments: The same PG cannot be assigned multiple net numbers.

When this field is set to zero, the Terminal will ignore the contents of the associated NET NUMBER field (AP151).

It is used, together with AP151 NET NUMBER. When an Init Data Change FIM is received that changes the value of these parameters, the Terminal shall perform as described in the referenced section of the SS-JC-10002. If the net number request is rejected (see SS-JC-10002 3.2.1.1.1.8.6.2.b), or the validity check (see SS-JC-10002 3.2.1.1.1.8.6.2.b.3) fails, a "Data Conflict" will be generated and sent to the Host by means of FOM03. If the net number request is accepted, the AP151 is not 127 and the validity checking is passed, the AP151, AP078 , AP093, AP084, AP086, AP101 and AP103 NET NUMBER corresponding to this PG INDEX NUMBER will be updated with the new received value and all time slot assignments associated to this PG INDEX NUMBER will have their net numbers changed.

The Terminal shall reject any change to the "Net selection status" table (AP151) when it is in an operational state (i.e. CURRENT INITIALIZATION STATE set to "Load Complete, Validity Test in Progress," "Load Complete, Valid Data" or "Load Complete, Data Conflict").

Change to the "Net selection status" table (AP151) can be made using only AP366 and AP365 when the Terminal is in an operational state.

Appendix A

Field LABEL n

Identifier: AP155
Ref.: SS-JC-10002 Adaptable Parameter "L16 messages Label and sublabel authorized to delay reduction";
SS-JC-10002 3.2.1.1.1.20.3.4
Type: Unsigned Integer
Range: 0 to 31
Default: 0
Comments:

Field SUBLABEL n

Identifier: AP156
Ref.: SS-JC-10002 Adaptable Parameter "L16 messages Label and sublabel authorized to delay reduction";
SS-JC-10002 3.2.1.1.1.20.3.4
Type: Unsigned Integer
Range: 0 to 7
Default: 0
Comments:

**A.4.4.44 Additional label/sublabel for receipt/compliance (R/C) processing words
1-3 (words #1033-1035)**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
1033	0								LABEL 1				SUBLABEL 1			
1034	0								LABEL 2				SUBLABEL 2			
1035	0								LABEL 3				SUBLABEL 3			

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field LABEL n

Identifier: AP157
 Ref.: SS-JC-10002 Adaptable Parameter "Label and Sublabel of L16 messages capable of R/C processing";
 SS-JC-10002 3.2.1.1.1.14.1.f
 Type: Unsigned Integer
 Range: 0 to 31
 Default: 0
 Comments: If both AP157 and AP158 contain value 0 in the same initialization word, then value 0 for AP157 is interpreted as a “no statement” value (i.e. the J0.0 message cannot be used for receipt compliance purposes).

Field SUBLABEL n

Identifier: AP158
 Ref.: SS-JC-10002 Adaptable Parameter "Label and Sublabel of L16 messages capable of R/C processing";
 SS-JC-10002 3.2.1.1.1.14.1.f
 Type: Unsigned Integer
 Range: 0 to 7
 Default: 0
 Comments: If both AP157 and AP158 contain value 0 in the same initialization word, then value 0 for AP158 is interpreted as a “no statement” value (i.e. the J0.0 message cannot be used for receipt compliance purposes).

A.4.4.45 Test function words 1-2 (words #1036-1037)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
1036	MESSAGE ERROR RATE					RTT RATE							FAULTY LOOPBACK RATE 1			
1037	0		BDFLP TX				BDFLP RX				FAULTY LOOPBACK RATE 2					

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field MESSAGE ERROR RATE

Identifier: AP159

Ref.: SS-JC-10002 Adaptable Parameter "Message error rate above which operational BIT declares a communications/network degradation";
SS-JC-10002 3.2.5.2.6.2

Type: Coded

Values:

Value	Meaning
0	Message Error Rate is 1%
1	Message Error Rate is 2%
2	Message Error Rate is 3%
3	Message Error Rate is 4%
...
...
29	Message Error Rate is 30%
30	Message Error Rate is 50%
31	Message Error Rate is 100%

Default: 19 (20%)

Comments: Message Error Rate above which MIDS JTRS Operational BIT declares a communications/network degradation.

Field RTT RATE

Identifier: AP160

Ref.: SS-JC-10002 Adaptable Parameter "RTT success rate below which operational BIT declares a communications/ network degradation";
SS-JC-10002 3.2.5.2.6.2

Type: Unsigned Integer

Range/Units: 0 to 100 (LSB = 1%; Scale 0% to 100%)

Default: 80 (80%)

Comments: RTT Success Rate below which MIDS JTRS Operational BIT declares a communications/network degradation.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field FAULTY LOOPBACK RATE 1

Identifier: AP161
Ref.: SS-JC-10002 Adaptable Parameter "Faulty loopback rate above which operational BIT declares a communications/ network degradation";
SS-JC-10002 3.2.5.2.6.2
Type: Unsigned Integer
Range/Units: 1 to 10 (LSB = 1%; Scale 1% to 10%)
Default: 1 (1%)
Comments: Faulty Loopback Rate above which MIDS JTRS Operational BIT declares a communications/network degradation.

Field BLANKING DUTY FACTOR LIMIT TDMA TRANSMISSION (BDFLP TX)

Identifier: AP432
Ref.: SS-JC-10002 Adaptable Parameter "Blanking Duty Factor Limit TDMA transmission"; SS-JC-10002 3.2.3.2.1.d
Type: Unsigned Integer
Range/Units: 0 to 10 (LSB = 10%; Scale 0% to 100%)
0 = disabled
Default: 0 (disabled)
Comments: Blanking Duty Factor Limit parameter for TDMA Transmission.
The Terminal shall report the excessive blanking to the Host when blanking duty factor exceeds BDFLP TX.
A 0 value disables the function.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field BLANKING DUTY FACTOR LIMIT TDMA/TACAN RECEPTION (BDFLP RX)

Identifier: AP433
Ref.: SS-JC-10001 Adaptable Parameter "Blanking Duty Factor Limit TDMA/TACAN Reception"; SS-JC-10002 3.2.3.2.1.d
Type: Unsigned Integer
Range/Units: 0 to 10 (LSB = 10%; Scale 0% to 100%)
0 = disabled
Default: 0 (disabled)
Comments: Blanking Duty Factor Limit parameter for TDMA/TACAN Reception.
The Terminal shall report the excessive blanking to the Host when blanking duty factor exceeds BDFLP RX.
A 0 value disables the function.

Field FAULTY LOOPBACK RATE 2

Identifier: AP162
Ref.: SS-JC-10002 Adaptable Parameter "Faulty loopback rate of expected TOA messages deviated of more than 300 nanoseconds above which operational BIT declares a communication/network degradation";
SS-JC-10002 3.2.5.2.6.2
Type: Unsigned Integer
Range/Units: 1 to 20 (LSB = 5%; Scale 5% to 100%)
Default: 2 (10%)
Comments: The Terminal declares a communications/network degradation when more than "FAULTY LOOPBACK RATE 2" of the loopback messages detected in any 12-second interval had a time of arrival that deviated from the expected value by more than 300 nanoseconds.

A.4.4.46 Displaced station position latitude (words #1038-1039)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Field VARIABLE DEFINITION NET SELECTION PG A INDEX NUMBER

Identifier: AP481
Ref: SS-JC-10002 3.2.1.1.1.8.6.2.e.1 & 3.2.1.1.1.8.6.2.f
Type: Unsigned integer
Range/Units: 0, 4 to 511, except 9, 12, and 13
(0 = No Statement)
Default: 0
Comment: Defines one of two PG index numbers (AP481 and AP482) to which net selection variable definition words apply. The two PGs shall be among those defined by AP152. [SS/ICS App A V1 53610]

Field VARIABLE DEFINITION NET SELECTION PG B INDEX NUMBER

Identifier: AP482
Ref: SS-JC-10002 3.2.1.1.1.8.6.2.e.1 & 3.2.1.1.1.8.6.2.f
Type: Unsigned integer
Range/Units: 0, 4 to 511, except 9, 12, and 13
(0 = No Statement)
Default: 0
Comment: Defines one of two PG index numbers (AP481 and AP482) to which net selection variable definition words apply. The two PGs shall be among those defined by AP152. [SS/ICS App A V1 53618]

Field PG A TIME SLOT ASSIGNMENT ORIGINAL CRYPTO MODE VALUE (CMA)

Identifier: AP493
Ref.: SS-JC-10002 3.2.1.1.1.8.6.2.e.3
Type: Coded
Values:

Value	Meaning
0	Common Variable Mode
1	Partitioned Variable Mode

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Default: 0
Comment: Defines the original Crypto Mode Value for PG A. It shall be set by the Terminal when a net change results in the supplanting of the originally assigned Crypto Mode. Host changes shall be ignored by the Terminal.[SS/ICS App A V1 53627]

Field PG A TIME SLOT ASSIGNMENT ORIGINAL TRANSEC CVLL

Identifier AP483
Ref: SS-JC-10002 3.2.1.1.1.8.6.2.e.3 & 3.2.1.1.1.8.6.2.f.2
Type; Unsigned Integer
Range; 0 to 127
Default: 0
Comment: Defines the original TRANSEC CVLL for PG A. It shall be set by the Terminal when a net change results in the supplanting of the originally assigned CVLL. Host changes shall be ignored by the Terminal.[SS/ICS App A V1 53634]

Field PG A TIME SLOT ASSIGNMENT ORIGINAL MSEC CVLL

Identifier AP484
Ref: SS-JC-10002 3.2.1.1.1.8.6.2.e.3 & 3.2.1.1.1.8.6.2.f
Type; Unsigned Integer
Range; 0 to 127
Default: 0
Comment: Defines the original MSEC CVLL for PG A. It shall be set by the Terminal when a net change results in the supplanting of the originally assigned CVLL. Host changes shall be ignored by the Terminal.[SS/ICS App A V1 53641]

Field PG B TIME SLOT ASSIGNMENT ORIGINAL CRYPTO MODE VALUE (CMB)

Identifier: AP494
Ref.: SS-JC-10002 3.2.1.1.1.8.6.2.e.3
Type: Coded
Values:

Value	Meaning
0	Common Variable Mode
1	Partitioned Variable Mode

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Default: 0
Comment: Defines the original Crypto Mode Value for PG B. It shall be set by the Terminal when a net change results in the supplanting of the originally assigned Crypto Mode. Host changes shall be ignored by the Terminal.[SS/ICS App A V1 53650]

Field PG B TIME SLOT ASSIGNMENT ORIGINAL TRANSEC CVLL

Identifier AP485
Ref: SS-JC-10002 3.2.1.1.1.8.6.2.e.3 & 3.2.1.1.1.8.6.2.f
Type; Unsigned Integer
Range; 0 to 127
Default: 0
Comment: Defines the original TRANSEC CVLL for PG B. It shall be set by the Terminal when a net change results in the supplanting of the originally assigned CVLL. Host changes shall be ignored by the Terminal.[SS/ICS App A V1 53657]

Field PG B TIME SLOT ASSIGNMENT ORIGINAL MSEC CVLL

Identifier AP486
Ref: SS-JC-10002 3.2.1.1.1.8.6.2.e.3 & 3.2.1.1.1.8.6.2.f
Type; Unsigned Integer
Range; 0 to 127
Default: 0
Comment: Defines the original MSEC CVLL for PG B. It shall be set by the Terminal when a net change results in the supplanting of the originally assigned CVLL. Host changes shall be ignored by the Terminal.[SS/ICS App A V1 53664]

Field PG A NUMBER OF CHANNELS/NETS (NCA)

Identifier: AP487
Ref.: SS-JC-10002 3.2.1.1.1.8.6.2.e.1
Type: Unsigned integer
Range/units: 0 to 16
Default: 0 (no channels)
Comments: Number of nets in the block for PG A, with which CVLLs may be associated. Net numbers must be contiguous, but not all nets must have an associated CVLL.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field PG A STARTING NET NUMBER (SNNA)

Identifier: AP488
Ref.: SS-JC-10002 3.2.1.1.1.8.6.2.e.1
Type: Unsigned integer
Range/units: 0 to 126
127 = No statement
Default: 0
Comments: First net number in the sequence of nets for PG A, with which CVLLs will be associated. The starting net number plus the number of channels must not exceed 127.

Field PG B NUMBER OF CHANNELS/NETS (NCB)

Identifier: AP489
Ref.: SS-JC-10002 3.2.1.1.1.8.6.2.e.1
Type: Unsigned integer
Range/units: 0 to 16
Default: 0 (no channels)
Comments: Number of nets in the block for PG B, with which CVLLs may be associated. Net numbers must be contiguous, but not all nets must have an associated CVLL.

Field PG B STARTING NET NUMBER (SNNB)

Identifier: AP490
Ref.: SS-JC-10002 3.2.1.1.1.8.6.2.e.1
Type: Unsigned integer
Range/units: 0 to 126
127 = No statement
Default: 0
Comments: First net number in the sequence of nets for PG B, with which CVLLs will be associated. The starting net number plus the number of channels must not exceed 127.

Field CVLL VALIDITY (V)

Identifier: AP491
Ref.: SS-JC-10002 3.2.1.1.1.8.6.2.e.2
Type: Boolean
Values: Logic 1 = CVLL is valid
Logic 0 = CVLL is not valid (Instead, use the CVLL in the original non-relay time slot assignments and paired PG relay assignments.)
Default: Logic 0 (not valid)
Comments:

Field CVLL FOR NET N

Identifier: AP492
Ref.: SS-JC-10002 3.2.1.1.1.8.6.2.e.2 and 3.2.1.1.1.8.6.2.f (a-c)
Type: Unsigned integer
Range/units: 0 to 127
0 = No statement
Default: 0
Comments: For each non-relay time slot assignment and paired PG relay assignment with which the Terminal is operating, has pending, or has suspended, for which the selected net corresponds to a valid CVLL in the variable definition words, the Terminal shall change the assignment's:[SS/ICS App A V1 53710]

1. MSEC CVLL to the variable definition CVLL if the assignment specifies the partitioned variable mode and the originally assigned MSEC CVLL is less than 120, except that for paired slot relay assignment in which the MSEC CVLL is set to no statement, no change shall be made:[SS/ICS App A V1 53711]
2. TRANSEC CVLL and MSEC CVLL to the variable definition CVLL if the assignment is in the partitioned variable mode and the originally assigned MSEC CVLL is equal to or greater than 120 except that for paired relay slot assignment in which the MSEC CVLL is set to no statement, only the TRANSEC CVLL shall be changed; or[SS/ICS App A V1 53712]
3. TRANSEC CVLL and MSEC CVLL to the variable definition CVLL if the assignment is in the common cryptomode.
If this field = 0 and the corresponding validity bit = logic 1, the Terminal shall reset the validity bit to logic 0 and report a data conflict to the host.[SS/ICS App A V1 53714]

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

A.4.4.51 Message filtering blocks (words #1081-1285)

The section defines the Adaptable Parameters related to the filtering performed on the messages received from the MIDS network before passing them to the Host. This filtering processing is completely defined in SS-JC-10002 section 3.2.1.1.1.20.3.1. In particular, SS-JC-10002 3.2.1.1.1.20.3.1.5 defines the exact order in which the Terminal shall apply the different filters.

The item "Ref." under the definition of each Adaptable Parameter in this section identifies precisely the SS-JC-10002 section that defines the corresponding filter; refer to the corresponding SS-JC-10002 section for the complete definition of each filter.

Also, as stated in SS-JC-10002 3.2.1.1.1.20.3.1, "all host interface message filters shall be enabled or disabled by adaptable parameters": this is the purpose of the Filter Selection Words 1-3 defined in the first sub-section below.

A.4.4.51.1 Filter selection words 1-3 (words #1081-1083)

Field PG_i, where i = 1 to 30

Identifier: AP457
Ref.: SS-JC-10002 Adaptable Parameter "30 protected PGs"; SS-JC-10002 3.2.1.1.1.8.3.3.12, 3.2.1.1.1.8.3.4.r & 3.2.1.1.1.10.2.d
Type: Unsigned Integer
Values: 0 to 511
Default: 0 = no entry
Comments: These entries cannot be modified directly by the host. Identity of a PG that is protected from certain network management commands received over the air. Filled in by the Terminal and paired with CVLL_i when time slot assignment blocks (A.4.4.28) and MSEC variable definition table entries (A.4.4.33) meet certain criteria. When a PG is protected, over-the-air received J0.3 transmit assignment additions and J0.6 C3 and C4 cryptovvariable logical label commands must meet certain criteria before being accepted for further processing. Once calculated by the Terminal, this field is not zeroed except when the host provides the following inputs:

1. All PG_i entries in the Current Use Set are zeroed after a "Restart Load Using Defaults" (see A.7.1.3.3 of Volume II), or
2. All PG_i entries in a stored set are zeroed when the set is replaced by a new load (see A.7.1.3.5 of Volume II).

Field CVLL_i, where i = 1 to 30

Identifier: AP458
Ref.: SS-JC-10002 Adaptable Parameter "30 protected CVLLs"; SS-JC-10002 3.2.1.1.1.8.3.3.12, 3.2.1.1.1.8.3.4.r, 3.2.1.1.1.10.2.d
Type: Unsigned Integer
Values: 0 or 96 to 127
Default: 0 = no entry
Comments: These entries cannot be modified directly by the host. Cryptovvariable logical label of a key that is associated with PG_i. Filled in by the Terminal when time slot assignment blocks (A.4.4.28) and MSEC variable definition table entries (A.4.4.33) meet certain criteria. When a PG is protected, over-the-air received J0.3 transmit assignment additions and J0.6 C3 and C4 cryptovvariable logical label commands must meet certain criteria before being accepted for further processing. Once calculated by the Terminal, this field is not zeroed except when the host provides the following inputs:

A.4.4.54 Reserved

A.4.4.55 Compensation of lever arm effects words 1-16 (word #1531-1546)

These define the location of the various shipboard navigation-related system in the ship's body coordinate frame (b-frame). The b-frame is centered at one of the primary navigation systems. Electromagnetic (EM) Underwater LOG body coordinates are not currently used, but are defined and are reserved for future use.

Field NETNAME_n

Identifier: AP1200
Ref.: SS-JC-10002 Adaptable Parameter "Waveform network name"
SS-JC-10002 3.2.1.1.1.4.7
SS-JC-10002 3.2.1.1.1.13.3
Type: ASCII
Values:
Default: 0
Comments: The Waveform Network Name can only be changed if the initialization state is not "Load Complete". If the Host writes to the adaptable parameter to change the Waveform Network Name while in a "Load Complete" state, the Link 16 Waveform rejects the adaptable parameter change and sets the initialization state to "Load Complete, Data Conflict".

If "NETNAME_n" = 0 for n=0 to 15, then the Link 16 Waveform will use a default value of LNK16MIDS000<null><null><null><null>, where "L" is the least significant byte in the first word (corresponds to NETNAME_0) and <null> denotes one (1) ASCII null (0x00) character.

Field NET NUMBER

Identifier: AP366

Ref.: SS-JC-10002 Adaptable Parameter "Net number request for net selection"; SS-JC-10002 3.2.1.1.1.8.6.2.b

Type: Unsigned Integer

Range: 0 to 126 (127 is illegal)

Default: 0

Comments: It is used together with AP365 PG INDEX NUMBER as described below.
If the net number requested is 127, the Terminal shall reject the change and retain the previous net number request for the PG and, in accordance with SS-JC-10002 3.2.1.1.1.8.6.2.f.3, retain the previous TRANSEC CVLL and MSEC CVLL.[SS/ICS App A V1 53717]

Field PG INDEX NUMBER

Identifier: AP365

Ref.: SS-JC-10002 Adaptable Parameter "PG index number for net selection"; SS-JC-10002 3.2.1.1.1.8.6.2.b

Type: Unsigned Integer

Range: 0, 4 to 511 except 9, 12, 13
(0 = No Statement)

Default: 0

Comments: It is used, together with AP366 NET NUMBER. When an Init Data Change FIM is received that changes the value of these parameters, the Terminal shall perform as described in the referenced section of the SS-JC-10002. If the net number

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

request is rejected (see SS-JC-10002 3.2.1.1.1.8.6.2.b), or the validity check (see SS-JC-10002 3.2.1.1.1.8.6.2.b.3) fails, a "Data Conflict" will be generated and sent to the Host by means of FOM03. If the net number request is accepted, the AP366 is not 127 and the validity checking is passed, the AP078, AP084, AP086, AP093, AP101, AP103 and AP151 NET NUMBER corresponding to this PG INDEX NUMBER shall be updated with the new received value and all time slot assignments associated with this PG INDEX NUMBER shall have their net numbers changed. If the validity check (see SS-JC-10002 3.2.1.1.1.8.6.2.b.3) fails, a "Data Conflict" shall be generated and indicated to the Host by means of FOM03. The net numbers in the assignment shall be returned to the value in AP151. If AP366 is 127, then the Terminal shall reject the change and retain the previous net number request for the PG and, in accordance with SS-JC-10002 3.2.1.1.1.8.6.2.f.3, retain the previous TRANSEC CVLL and MSEC CVLL. Changes to the "Net selection status" table (AP151) can be made using only AP366 and AP365 when the Terminal is in an operational state (i.e. CURRENT INITIALIZATION STATE set to "Load Complete, Validity Test in progress," "Load Complete, Valid Data" or "Load Complete, Data Conflict").[SS/ICS App A V1 18180]

Values: Logic 0 = No Action
Logic 1 = Reinitiate Net Entry
Default: 0
Comments: This parameter is used to start the Net Entry. See A.5.3.5.1 and A.5.3.5.2. Upon setting this adaptable parameter, the Terminal will automatically set the Start Net Entry adaptable parameter (AP353). Once AP321 is set, the Terminal's synchronization state of fine synchronization achieved shall be maintained through any power interrupt whose duration is less than 10 seconds. Once AP321 is set, the Terminal, if it was attempting to achieve fine synchronization, shall reinitiate network entry after any power interrupt whose duration is less than 10 seconds.

Field TRANSMIT PG QUEUES 1-10 CLEAR (PG Q 1-10)

Identifier: AP401
Ref.: SS-JC-10002 Adaptable Parameter "Clear all ten transmit PG queues"; SS-JC-10002 3.2.1.1.1.20.3.3.a.6
Type: Boolean
Values: Logic 0 = No Action
Logic 1 = Clear Transmission Queue from 1 to 10
Default: 0
Comments:

Field TRANSMIT PG QUEUE X CLEAR (PG Q X) (where X is in 1 to 10)

Identifier: AP402 to AP411
Ref.: SS-JC-10002 Adaptable Parameter "Clear transmit queue for PG 1..10"; SS-JC-10002 3.2.1.1.1.20.3.3.a.6
Type: Boolean
Values: Logic 0 = No Action
Logic 1 = Clear Transmit PG X Queue
Default: 0
Comments:

Field TRANSMIT OTHER PGs QUEUE CLEAR (PG OTH Q)

Identifier: AP412
Ref.: SS-JC-10002 Adaptable Parameter "Clear queue for other transmit PGs"; SS-JC-10002 3.2.1.1.1.20.3.3.b.4
Type: Boolean
Values: Logic 0 = No Action
Logic 1 = Clear Other PGs Queue
Default: 0
Comments:

Field BIT FILE CONTROL (BFC)

Identifier: AP439
Ref.: SS-JC-10001 Adaptable Parameter "BIT Capture Files"; SS-JC-10001 3.2.1.26.8
Type: Coded
Values:

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
0	No Action
1	Clear Start-up BIT Capture File
2	Clear Cumulative Operational BIT Capture File
3	Clear Start-up BIT Capture File and Cumulative Operational BIT Capture File
4	Clear Manually Initiated BIT Capture File
5	Clear Start-up BIT Capture File and Manually Initiated BIT Capture File
6	Clear Cumulative Operation BIT Capture File and Manually Initiated BIT Capture File
7	Clear All Capture Files

Default: 0

Comments:

A.4.4.76 BIT threshold words (words #1840-1841)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
1840	0								NUMBER OF HIGH VSWR PULSES IN A TRANSMIT MESSAGE PACKAGE							
1841	0								NUMBER OF EXTREMELY WEAK PULSES IN A TRANSMIT MESSAGE PACKAGE							

Field NUMBER OF HIGH VSWR PULSES IN A TRANSMIT MESSAGE PACKAGE

Identifier: AP607

Ref.: SS-JC-10002 Adaptable Parameter "Number of high Voltage Standing Wave Ratio (VSWR) pulses in a time slot"; SS-JC-10002 3.2.5.2.6.2.1.g.2(b)

Type: Unsigned Integer

Range: 1 to 256

Default: 2

Comments: Number of high VSWR pulses in a transmit message package causing operational BIT to declare a Terminal degradation.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field NUMBER OF EXTREMELY WEAK PULSES IN A TRANSMIT MESSAGE PACKAGE

Identifier: AP608
 Ref.: SS-JC-10002 Adaptable Parameter "Number of extremely weak pulses in a time slot"; SS-JC-10002 3.2.5.2.6.2.1.g.4(g)
 Type: Unsigned Integer
 Range: 1 to 256
 Default: 2
 Comments: Number of extremely weak pulses in a transmit message package causing operational BIT to declare a Terminal failure.

A.4.4.77 Mode control word (word #1861)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
1861	RF LOOPBACK CONTROL				0				GLOBAL RECEIVE ANTENNA	GLOBAL TRANSMIT ANTENNA	SNE	TOR	0	RI		

Field RF LOOPBACK CONTROL

Identifier: AP010
 Ref.: SS-JC-10002 Adaptable Parameter "RF loopback control"; SS-JC-10002 3.2.5.2.6.2
 Type: Coded
 Values:

Value	Meaning
0	Not Used
1	Baseband Loopback - Antenna A
2	Baseband Loopback - Antenna B
3	Baseband Loopback - Antenna A&B
4	Not Used
5	RF Loopback - Antenna A
6	RF Loopback - Antenna B
7	RF Loopback - Alternate Antenna A&B
8-15	Not Used

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Default: 7

Comments: This AP should be set to RF Loopback for normal operation. If baseband loopback is selected (a test mode), the Terminal will transmit at a reduced level out the antenna ports and BIT faults may be set. The values 3 and 7 are used in dual antenna transmit mode (AP351, GLOBAL TRANSMIT ANTENNA, value 0) to cause the Terminal to process loopbacks alternately from the two antenna paths.

Field GLOBAL RECEIVE ANTENNA

Identifier: AP350

Ref.: SS-JC-10002 Adaptable Parameter "Receive Antenna";
SS-JC-10002 3.2.1.1.1.23.6.c

Type: Coded

Values:

Value	Meaning
0	Receive on both antennas
1	Receive on antenna A only
2	Receive on antenna B only
3	Receive on both antennas

Default: 0

Comments: This field contains the selection of which antenna ports are to be used for reception.

Field GLOBAL TRANSMIT ANTENNA

Identifier: AP351

Ref.: SS-JC-10002 Adaptable Parameter "Transmit Antenna";
SS-JC-10002 3.2.1.1.1.21.1.a

Type: Coded

Values:

Value	Meaning
0	Transmit on both antennas
1	Transmit on antenna A only
2	Transmit on antenna B only
3	Mixed

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Default: 1
Comments: This field contains the selection of which antenna ports are to be used for Transmission. When set to "Mixed," the Terminal will use the Transmit Antenna specified on a PG basis in the Transmit PG Related Data initialization blocks.

Field START NET ENTRY (SNE)

Identifier: AP353
Ref.: SS-JC-10002 Adaptable Parameter "Start net entry"
SS-JC-10002 3.2.1.1.1.5.4.3.a
Type: Boolean
Values: Logic 1 = Automatically Start Net Entry
Logic 0 = Do Not Start Net Entry
Default: 0
Comments: This parameter shall not be stored in the File System. It shall be set to logic 1 by the host platform when entry into the Link 16 network is desired. See A.5.3.5.1 and A.5.3.5.2. Once this parameter is set, the Terminal's synchronization state of fine synchronization achieved shall be maintained through any power interrupt whose duration is less than 10 seconds. Once this parameter is set, the Terminal, if it was attempting to achieve fine synchronization, shall reinitiate network entry after any power interrupt whose duration is less than 10 seconds.

Field THERMAL OVERRIDE (TOR)

Identifier: AP354
Ref.: SS-JC-10001 Adaptable Parameter "Thermal Override";
SS-JC-10002 3.2.3.1.1.3.2, SS-JC-10001 3.2.1.18.2.1.1.2.2
Type: Boolean
Values: Logic 1 = Thermal Override
Logic 0 = Normal Operation
Default: 0
Comments: Operating in Thermal Override may damage the Terminal. For this reason a setting of this parameter to "Thermal Override" will not be stored in the File System by the Terminal: the Terminal will only store it into volatile RAM and Thermal Override will remain in effect until it is changed by the operator, a power

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

interrupt occurs, or an initialization restart takes place. AP354 is supported in the TACAN Standalone operation mode.

Field RELAY INHIBIT (RI)

Identifier: AP355
Ref.: SS-JC-10002 Adaptable Parameter "Relay Inhibit"; SS-JC-10002 3.2.3.1.1.3.6
Type: Boolean
Values: Logic 1 = Relay Inhibit
Logic 0 = Relay Allow
Default: 0
Comments: This field inhibits the relay function. Unlike a Suspended setting of the Relay Control field (AP099), Relay Inhibit permits Terminal receipt of messages in accordance with parameters in Relay Time Slot Assignment Blocks.

A.4.4.78 Voice channel select (word #1862)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
1862	0	VOICE B CHANNEL							0	VOICE A CHANNEL						

Field VOICE B CHANNEL

Identifier: AP279
Ref.: SS-JC-10002 Adaptable Parameter "Voice group B channel selection";
SS-JC-10002 3.2.1.1.1.8.3.3.8;
SS-JC-10002 3.2.1.1.1.8.6.1
Type: Unsigned Integer
Range: 0 to 127
(127 = Voice Group B Channel is deactivated)
Default: 127
Comments: Voice Group B Channel Net Number.

1. if the voice channel (VC) is 127, deactivate voice;
2. if VC is not 127 and there exists TSAs with the same net, those assignments are used;
3. if VC is not 127, TSAs do not exist with the same net, and TSAs do exist with nets of 127, those assignments are used;
4. if VC is not 127, TSAs do not exist with the same net, and TSAs do not exist with nets of 127, voice not used.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field VOICE A CHANNEL

Identifier: AP280
Ref.: SS-JC-10002 Adaptable Parameter "Voice group A channel selection";
SS-JC-10002 3.2.1.1.1.8.3.3.8;
SS-JC-10002 3.2.1.1.1.8.6.1
Type: Unsigned Integer
Range: 0 to 127
(127 = Voice Group A Channel is deactivated)
Default: 127
Comments: Voice Group A Channel Net Number.
1. if the voice channel (VC) is 127, deactivate voice;
2. if VC is not 127 and there exists TSAs with the same net, those assignments are used;
3. if VC is not 127, TSAs do not exist with the same net, and TSAs do exist with nets of 127, those assignments are used;
4. if VC is not 127, TSAs do not exist with the same net, and TSAs do not exist with nets of 127, voice not used.

A.4.4.79 Control channel select (word #1863)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
1863	0										CONTROL CHANNEL					

Field CONTROL CHANNEL

Identifier: AP281
Ref.: SS-JC-10002 Adaptable Parameter "Control channel selection";
SS-JC-10002 3.2.1.1.1.8.3.3.9.a;
SS-JC-10002 3.2.1.1.1.8.6.1.a
Type: Unsigned Integer
Range: 0 to 127
(127 = Control Channel is deactivated)
Default: 127
Comments: Control Channel Net Number.
1. if CONTROL CHANNEL is 127, the Control Channel is deactivated;
2. if CONTROL CHANNEL is not 127 and there exists TSAs with the same net number, those assignments are used;

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

3. if CONTROL CHANNEL is not 127, there are no TSAs with the same net, but there are TSAs with net of 127, those assignments are used;
4. if CONTROL CHANNEL is not 127, there are no TSAs with the same net, and there are no TSAs with net of 127, CONTROL CHANNEL is not used.

A.4.4.80 Time of day (TOD) words 1-2 (words #1865-1866)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
1865	VAL	0				HOURS					MINUTES					
1866	0		SECONDS						0							

Comments: The Time Of Day words 1-2, when valid (AP285), are used by the Terminal to overwrite the Terminal Chronometer (See MIDS Time of Day, A.5.3.5.1 and Terminal Chronometer Time, A.5.3.5.2).

Field TIME OF DAY VALIDITY (VAL)

Identifier: AP285
Ref.: SS-JC-10002 Adaptable Parameter "Time of day validity"; SS-JC-10002 3.2.1.1.1.5.4.3.b
Type: Boolean
Values: Logic 1 = Time of Day Valid
Logic 0 = Time of Day not Valid
Default: 0
Comments: This bit is not stored in the File System.

Field HOURS

Identifier: AP286
Ref.: SS-JC-10002 Adaptable Parameter "Time of day, hours";
SS-JC-10002 3.2.1.1.1.5.4.3
Type: Unsigned Integer
Range/Units: 0 to 23 hours
Default: 0
Comments: Time of Day Hours.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field MINUTES

Identifier: AP287
Ref.: SS-JC-10002 Adaptable Parameter "Time of day, minutes";
SS-JC-10002 3.2.1.1.1.5.4.3
Type: Unsigned Integer
Range/Units: 0 to 59 minutes
Default: 0
Comments: Time of Day Minutes.

Field SECONDS

Identifier: AP288
Ref.: SS-JC-10002 Adaptable Parameter "Time of day, seconds";
SS-JC-10002 3.2.1.1.1.5.4.3.b
Type: Unsigned Integer
Range/Units: 0 to 59 Seconds
Default: 0
Comments: Time of Day Seconds.

A.4.4.81 Time of day error (word #1867)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
1867	VAL	0				ERROR MINUTES						ERROR SECONDS				

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field TIME OF DAY ERROR VALIDITY (VAL)

Identifier: AP289
Ref.: SS-JC-10002 Adaptable Parameter "Time of day error validity"; SS-JC-10002 3.2.1.1.1.5.4.3.b
Type: Boolean
Values: Logic 1 = Time of Day Error Valid
Logic 0 = Time of Day Error Invalid
Default: 0
Comments: This bit is reset to 0 by the Terminal upon Coarse Synch. Confirmed. When this field is set to Logic value 0 (TOD Error Invalid) the Terminal will use the default TOD Error of 6 seconds, plus 6 seconds times the number of days since the chronometer was synchronized to network time. This bit is not stored in the File System.
Note: This bit is checked immediately before the TOD error is applied. Setting it to zero before coarse sync confirmed and before Net Entry will cause the default value to be used when Net Entry or Net Entry Reset is performed if the waiting time is exceeded.

Field ERROR MINUTES

Identifier: AP290
Ref.: SS-JC-10002 Adaptable Parameter "Time of day error, minutes";
SS-JC-10002 3.2.1.1.1.5.4.3
Type: Unsigned Integer
Range/Units: 0 to 59 minutes
Default: 0
Comments: Time of Day Error Minutes is an uncertainty in the estimate of Time of Day Minutes.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field ERROR SECONDS

Identifier: AP291

Ref.: SS-JC-10002 Adaptable Parameter "Time of day error, seconds";
SS-JC-10002 3.2.1.1.1.5.4.3

Type: Unsigned Integer

Range/Units: 0 to 59 seconds

Default: 6

Comments: Time of Day Error Seconds is an uncertainty in the estimate of Time of Day Seconds.

Note:

- If the Terminal has been assigned as the Net Time Reference (AP015 NETWORK TIME REFERENCE) then this word is not used by the Terminal.
- The Terminal will use the default value of 6 seconds for the TOD Error when TOD Error of 6 seconds or less is entered, or if the Net Entry Status changes from "Net Entry Has Not Begun" to one of the following states:
 - "Coarse Synchronization Achieved"
 - "Coarse Synchronization Confirmed"
 - "Fine Synchronization Achieved"

A.4.4.82 TACAN control words 1-4 (words #1868-1871)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
1868	TACAN ANTENNA	0	1	POWER TEST	TAC MOD	TR/RO	X/Y	0	TACAN CHANNEL							
1869	0	ANTENNA B CABLE DELAY							0	ANTENNA A CABLE DELAY						
1870	0															CS
1871	0															

The Distance Measuring Equipment (DME) Delay will be selected automatically IAW STANAG 5034.

Note: The values of the APs conveyed in the TACAN FIM12 shall overwrite the corresponding fields in these initialization words.[SS/ICS App A V1 18883]

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field TACAN ANTENNA

Identifier: AP292

Ref.: SS-JC-10003 3.2.1.1.1.3 Adaptable Parameter "TACAN Antenna Selection"

Type: Coded

Values:

Value	Meaning
0	Auto Antenna Select
1	Modified Auto Antenna Select
2	Antenna B
3	Antenna A

Default: 0

Comments: TACAN Antenna Port Selection. Modified Auto Antenna Select shall be in accordance with SS-JC-10003 paragraph 3.2.1.1.1.3.b. AP292 is supported in the TACAN Standalone operation mode.

Field POWER TEST

Identifier: AP293

Ref.: SS-JC-10003 3.2.1.1.1.5.2.g Adaptable Parameter "Power Test"

Type: Boolean

Values: Logic 0 = Do Not Command IBIT
Logic 1 = Command IBIT

Default: 0

Comments: "Command IBIT" commands the Terminal to perform manually initiated BIT (IBIT). AP293 is not supported in the TACAN Standalone operation mode. "Do Not Command IBIT" commands the Terminal to run TACAN in normal as opposed to test mode. This bit is not stored in the File System.

Field TACAN MODE (TAC MOD)

Identifier: AP294

Ref.: SS-JC-10003 3.2.1.1.1.5.2.b Adaptable Parameter "TACAN mode"

Type: Coded

Values:

Value	Meaning
-------	---------

A-321

FOR OFFICIAL USE ONLY
UNCLASSIFIED

UNCLASSIFIED

Comments: AP294 is supported in the TACAN Standalone operation mode.

Field TRANSMIT/RECEIVE INDICATOR (TR/RO)

Identifier: AP295

Ref.: SS-JC-10003 3.2.1.1.1.5.2.e Adaptable Parameter "Transmit/Receive Indicator"

Type: Coded

Values:

Value	Meaning
0	Receive Only
1	Transmit/Receive

Default: 0

Comments: Transmit/Receive - Receive Only Indicator. AP295 is supported in the TACAN Standalone operation mode.

Field X/Y MODE (X/Y)

Identifier: AP296

Ref.: SS-JC-10003 3.2.1.1.1.5.2.f Adaptable Parameter "X/Y Mode"

Type: Coded

Values:

Value	Meaning
0	Y Mode
1	X mode

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Default: 0
Comments: AP296 is supported in the TACAN Standalone operation mode.

Field TACAN CHANNEL

Identifier: AP297
Ref.: SS-JC-10003 3.2.1.1.1.5.2.a Adaptable Parameter "TACAN Channel"
Type: Unsigned Integer
Range: 1 to 126
Default: 1
Comments: TACAN Channel Number. AP297 is supported in the TACAN Standalone operation mode.

Field ANTENNA B CABLE DELAY

Identifier: AP299
Ref.: SS-JC-10003 3.2.1.1.1.5.2.d Adaptable Parameter "TACAN Antenna Cable Delay"
Type: Unsigned Integer
Range/Units: 0 to 63 (LSB = 100ns; Scale 0-6300ns)
Default: 0
Comments: When the value 0 is entered for the TACAN antenna A and B cable delays the Terminal shall take the values entered for the TDMA cable delay antenna A and B receive (AP311 and AP313) and copy them into the fields for the TACAN delays. AP299 is supported in the TACAN Standalone operation mode.[SS/ICS App A V1 18998]

Field ANTENNA A CABLE DELAY

Identifier: AP300
Ref.: SS-JC-10003 3.2.1.1.1.5.2.d Adaptable Parameter "TACAN Antenna Cable Delay"
Type: Unsigned Integer
Range/Units: 0 to 63 (LSB = 100ns; Scale 0-6300ns)
Default: 0
Comments: When the value 0 is entered for the TACAN antenna A and B cable delays the Terminal would take the values entered for the TDMA cable delay antenna A and B receive (AP311 and AP313) and copy them into the fields for the TACAN delays. AP300 is supported in the TACAN Standalone operation mode.

FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field CONTROL SELECT (CS)

Identifier: AP437

Ref.: SS-JC-10003 3.2.1.1.1.5.3.a Adaptable Parameter "Control Select"

Type: Coded

Values:

Value	Meaning
0	The TACAN flight control data (Word 1868) is provided via the TACAN serial control bus defined in section 4.2.4.7.1.2.
1	The TACAN flight control data (Word 1868) is provided via the Host data bus.

Default: 0

Comments: The CS field is only applicable to platform type N, as defined in ICS-JC-10002 (I/O configuration identifier). A setting of zero for platform type other than N shall not prevent TACAN control information from being received over the Host data bus.[SS/ICS App A V1 19023] The Control Select Adaptable Parameter is stored by the Terminal and is not part of the TACAN control data provided to the TACAN Waveform. The value of CS AP437 (Word 1870) will be overwritten by the value of the TACAN FIM22 Control Select field. AP293 within Word 1868 is not supported in the TACAN Standalone operation mode.

SS-JC-10002 3.2.1.1.1.20.2.2.2
Default: 0 (0 = Do Not Interpret Link 4 Address)
Comments: TADIL C Address Indicator, as defined in STANAG 5516 Annex E - Data Element Dictionary (Data Field Identifiers E1718 - Link 4 Address Indicator).

A.4.4.87 Date words 1-2 (words #1880-1881)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
1880	0				DATE, DAY OF YEAR (HUNDREDS DIGIT)				DATE, DAY OF YEAR (TENS DIGIT)				DATE, DAY OF YEAR (ONES DIGIT)			
1881	DATE, YEAR (TENS DIGIT)				DATE, YEAR (ONES DIGIT)				0							

Note: If the Date Words are set to all zeros (No Statement), or if any of the date fields are out of allowable range, the date will be considered invalid and the waveform will set the Date Needed bit in FOM29 active. The Link 16 Waveform requires a valid date to select cryptovars and will not enter the net without a valid date. The Link 16 Waveform performs an automatic initialization restart, when the date is changed over the databus. The Terminal updates the date when Midnight is crossed.

1890	Freq Re-map En	0												Remapped Frequency Number List: Freqs 48-50		

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

A.4.4.88.1 Field remapped frequency number list: FREQS 0-50 words #1882-1884, word #1890 bits 0-2

Identifier: AP701

Ref.: SS-JC-10002 Adaptable Parameter "Excluded frequency number list";
SS-JC-10002 3.2.1.1.1.2.10.5

Type: Boolean

Values: Logic 1 = This frequency number shall be unauthorized and replaced
Logic 0 = This frequency number shall be authorized

Default: 0

Comments: This field determines which of the frequency numbers, 0 to 50, shall be unauthorized by the Terminal and replaced by an authorized frequency, when frequency remapping is enabled. Bits 0 through 15 of Word 1882 correspond to frequency numbers 0 through 15, respectively. A value of 1 for any of these bits means that the corresponding frequency number shall be unauthorized and replaced. A value of 0 means that the corresponding frequency number is authorized. The bits in Words 1883 and 1884 correspond to frequencies 16 to 31 and 32 to 47, respectively. Bits 0 to 2 of Word 1890 correspond to frequencies 48 to 50. This field is applicable only when the FREQUENCY REMAPPING ENABLE field (AP700) is set to logic 1.

[Note: Among the 51 frequency numbers represented in Words 1882 to 1884 and 1890, the maximum number of frequencies that may be unauthorized shall be 14 and the minimum number shall be 1. The Terminal performs a check of this as required by SS-JC-10002 3.2.1.1.1.2.10.1 and 3.2.1.1.1.2.10.5. If the values provided in these fields indicate more than 14 or less than 1 unauthorized frequency numbers and if the FREQUENCY REMAPPING ENABLE field is set to 1 (enabled), the Terminal shall consider this to be invalid. The Terminal shall provide an alert to the host indicating that the input was invalid. A change to the frequency remapping enable or remapping frequency number list is invalid when the Terminal is in network entry, or coarse or fine synchronization. The Terminal shall inform the host of the invalid assignment.]

UNCLASSIFIED

ICS-JC-10002 Rev -
Appendix A

A.4.4.88.2 Field frequency remapping enable

word #1890, bit #15

Identifier: AP700
Ref.: SS-JC-10002 Adaptable Parameter "Frequency re-mapping enable"; SS-JC-10002 3.2.1.1.1.2.10.1 & 3.2.1.1.1.2.10.5
Type: Boolean
Values: Logic 1 = Enable. Remapping of up to 14 of the 51 carrier frequency numbers is enabled
Logic 0 = Disable. Remapping is not enabled
Default: 0
Comments: When this bit is set to logic 1, the Terminal shall exclude transmission and reception of one to fourteen selected frequencies (as determined by the UNAUTHORIZED FREQUENCY NUMBER LIST) among the 51 in the set used by Link 16, and shall replace each unauthorized frequency with an authorized frequency in accordance with the reference. When this bit is set to logic 0, all of the 51 carrier frequencies are authorized, and the Terminal shall exclude none. A change to the frequency remapping enable or remapping frequency number list is invalid when the Terminal is in network entry, or coarse or fine synchronization. The Terminal shall inform the host of the invalid assignment.

A.4.4.89 Cable delay dual antenna (word #1886)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word	CABLE DELAY DUAL ANTENNA TRANSMIT															
1886																

Field CABLE DELAY DUAL ANTENNA TRANSMIT

Identifier: AP426
Ref.: SS-JC-10002 Adaptable Parameter "Dual antenna transmit cable delay"; SS-JC-10002 3.2.1.1.1.5.6.5
Type: Two's Complement Integer
Range/Units: -32768 to 32767 (LSB = 12.5 ns; Scale -409600.0 to 409587.5 ns)
Default: 0
Comments: When in the dual antenna mode, this field is used to establish a transmit keying time such that the transmission can be referenced to either antenna, or to an intermediate point between the antenna.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

A.4.4.90 Reserved

A.4.4.91 Cable delay HPA transmit (word #1888)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
1888	0								CABLE DELAY HPA TRANSMIT							

Field CABLE DELAY HPA TRANSMIT

Identifier: AP429

Ref.: SS-JC-10002 Adaptable Parameter "HPA transmit cable delay"; SS-JC-10002 3.2.1.1.1.5.6.5

Type: Unsigned Integer

Range/Units: 0 to 255 (LSB = 12.5 ns; Scale 0.0 to 3187.5 ns)

Default: 0

Comments: This parameter is used to specify the total cable delay from the RT LRU Exciter Port, through the HPA, and to the antenna or antennas. If the HPA configuration is for single antenna transmit, this parameter is similar to CABLE DELAY ANTENNA A TRANSMIT (AP312) or CABLE DELAY ANTENNA B TRANSMIT (AP314). If the HPA configuration is for dual antenna transmit, this parameter is similar to CABLE DELAY DUAL ANTENNA TRANSMIT (AP426). If HPA transmit is indicated by OUTPUT POWER MODE (AP011) or POWER SELECT (AP137), the GLOBAL TRANSMIT ANTENNA (AP351) and TRANSMIT ANTENNA (AP140) parameters are "don't care."

Appendix A

A.4.4.95 Init data change segment descriptor words (words 3871-3900)

The Initialization Data Change Segment Descriptor Words (also called Segment Descriptors in this section) are used to identify up to 15 segments of the initialization data file that are to be changed using the values conveyed by Short Initialization Data Change 1 FIM (FIM27) and Short Initialization Data Change 2 FIM (FIM28).

The Segment Descriptors specify segments of contiguous 16-bit words of the current initialization data file, indicating whether the segment applies to FIM27 or FIM28.

FIM27 Segment Descriptors are specified first, followed by FIM28 Segment Descriptors if any, finally followed by unused Segment Descriptors. The correspondence between the init data segments conveyed by a Short Initialization Data Change 1 or 2 FIM and the corresponding Segment Descriptor is given by the order in the FIM and in the list of descriptors for that FIM. An example is provided in A.4.4.95.b below. The total number of initialization data words specified for FIM27 (or FIM28), will not exceed 30 16-bits words (maximum length for FIM27 or FIM28).

Each Segment Descriptor consists of 2 words as defined in A.4.4.95.a below.

a. Segment Descriptor words definition:

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
I	FI		0								DATA WORD COUNT					
II	0			STARTING DATA WORD												

Field FIM ID (FI)

Identifier: AP602

Ref.: SS-JC-10002 Adaptable Parameter "15 FIM IDs for FIM27/28 changes to initialization words"; SS-JC-10002 3.2.1.1.1.20.1.2

Type: Coded

Values:

Value	Meaning
0	Segment Descriptor Unused (No segment defined)
1	FIM27 Segment Descriptor
2	FIM28 Segment Descriptor
3	Not Used

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Default: See TABLE A-LXXVIII.
Comments: Used to identify whether the Descriptor applies to FIM27, FIM28 or whether the segment descriptor is unused. This AP will only be processed when the Link 16 Waveform is in the "Awaiting Load", "Load in Progress" or "Load Complete, Segment Count Error" initialization states. The Link 16 Waveform will ignore any change to this AP if it is in another initialization state.

Field DATA WORD COUNT (DWC)

Identifier: AP603
Ref.: SS-JC-10002 Adaptable Parameter "15 data word counts for FIM27/28 changes to initialization words"; SS-JC-10002 3.2.1.1.1.20.1.2
Type: Unsigned Integer
Range/Units: 1 to 30 words
Default: See TABLE A-LXXVIII.
Comments: This field indicates the number of contiguous valid initialization 16-bit data words, including the Starting Data Word (SDW), contained in the initialization data segment. This AP will only be processed when the Link 16 Waveform is in the "Awaiting Load", "Load in Progress" or "Load Complete, Segment Count Error" initialization states. The Link 16 Waveform will ignore any change to this AP if it is in another initialization state.

Field STARTING DATA WORD (SDW)

Identifier: AP604
Ref.: SS-JC-10002 Adaptable Parameter "15 starting data word numbers for FIM27/28 changes to initialization words"; SS-JC-10002 3.2.1.1.1.20.1.2
Type: Unsigned Integer
Range: 1 to 8191
Default: See TABLE A-LXXVIII.
Comments: This field indicates the position in the initialization data file of the first word of the initialization data segment. This AP will only be processed when the Link 16 Waveform is in the "Awaiting Load", "Load in Progress" or "Load Complete, Segment Count Error" initialization states. The Link 16 Waveform will ignore any change to this AP if it is in another initialization state.

Appendix A

A.4.4.96 SPARE (words #3901-3990)

A.4.4.97 Time slot assignment blocks #65-384 (words #3991-5910)

Initialization Data Words 3991 to 5910 contain 320 Time Slot Assignment Blocks. (Initialization Data Words 61 to 444 contain 64 additional Time Slot Assignment Blocks for a total of 384. See Section A.4.4.28.) Each Time Slot Assignment Block is composed of six 16-bit words. When an initialization data change is made to a Time Slot Assignment Block, all six words must be submitted.

A Time Slot Assignment Block can be one of two types, indicated by the RS field in bit 14 of the first word:

- a. Non-Relay Time Slot Assignment Block

or

- b. Relay Time Slot Assignment Block

The composition of a Time Slot Assignment Block depends on its type. The format of each type of Time Slot Assignment Block is described in the following sections.

A.4.4.97.1 Non-relay time slot assignment block

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
I	0(*)	RS=0	CM	RECURRENCE RATE				NET NUMBER						SET

ICS-JC-10002 Rev -
Appendix A

Field RELAY INDICATOR (RS)

Identifier: AP075

Ref.: SS-JC-10002 Adaptable Parameter "Relay indicator";
SS-JC-10002 3.2.1.1.1.8.2

Type: Coded

Values:

Value	Meaning
0	Non-Relay Time Slot Assignment
1	Relay Time Slot Assignment

Default: 0

Comments: This field is used to switch layout for Time Slot Assignment blocks.
This bit must be set to Logic 0 for a Non-Relay Time Slot Assignment.

Field CRYPTO MODE (CM)

Identifier: AP076

Ref.: SS-JC-10002 Adaptable Parameter "Crypto mode";
SS-JC-10002 3.2.1.1.1.4.5 & 3.2.1.1.1.8.6.2.e.3

Type: Coded

Values:

Value	Meaning
0	Common Variable Mode
1	Partitioned Variable Mode

Default: 0

Comments: If the PG INDEX NUMBER field (AP087) is the same as the index number for either variable definition net selection PG (A.4.4.50), this variable may be replaced by the Original CryptoMode (AP493/494) as defined in SS-JC-10002 3.2.1.1.1.8.6.2.e.3 and section (A.4.4.50) of this *System/Segment Interface Control Document Appendix A*.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field RECURRENCE RATE

Identifier: AP077
Ref.: SS-JC-10002 Adaptable Parameter "Recurrence rate";
SS-JC-10002 3.2.1.1.1.8.2
Type: Unsigned Integer
Range: 2 to 15
(0,1 = Illegal)
Default: 2
Comments:

Field NET NUMBER

Identifier: AP078
Ref.: SS-JC-10002 Adaptable Parameter "Net number";
SS-JC-10002 3.2.1.1.1.4.6.6 & 3.2.1.1.1.8.2.c & 3.2.1.1.1.8.6.2.a
Type: Unsigned Integer
Range: 0 to 127
Default: 0
Comments: If the PG INDEX NUMBER field (AP087) is 9 (Control), 12 (Voice A), or 13 (Voice B), then the value 127 means "use channel net number" (AP281, AP280 or AP279 respectively), otherwise the value 127 is Illegal. If the PG INDEX NUMBER field is the same as an entry (AP152) in Net Selection By PG Words 1-8, A.4.4.41, then this field shall be consistent with all net number fields in all time slot assignment blocks belonging to this PG. Those fields include AP078, AP084, AP086, AP093, AP101 and AP103, as well as AP151. If AP151 equals 127, then the net number (AP078 or AP093) in the first paired PG relay assignment or non-relay time slot assignment for the PG shall be used for all net numbers, including the net number for the PG in the net selection status.

Field SET

Identifier: AP079
Ref.: SS-JC-10002 Adaptable Parameter "Set";
SS-JC-10002 3.2.1.1.1.2.2.2, SS-JC-10002 3.2.1.1.1.8.2;
Type: Coded
Values:

Value	Meaning
0	No Statement (Delete Block)

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
1	Set A
2	Set B
3	Set C

Default: 0

Comments: Time slot Set for this Time Slot Assignment Block.
If SET is set to "0" all fields in Time Slot Assignment block are "don't care" for validity purpose.

Field TRANSMIT/RECEIVE INDICATOR (T/R)

Identifier: AP080

Ref.: SS-JC-10002 Adaptable Parameter "Transmit indicator"
SS-JC-10002 3.2.1.1.1.8.2.e & 3.2.1.1.1.8.6.2.b.1

Type: Coded

Values:

Value	Meaning
0	Receive Slot Assignment
1	Transmit Slot Assignment

Default: 0

Comments: A receive slot assignment shall be subject to net selection only when the PG INDEX NUMBER (AP087) is an entry in A.4.4.41 (AP152).

Field INDEX NUMBER

Identifier: AP081

Ref.: SS-JC-10002 Adaptable Parameter "Index number";
SS-JC-10002 3.2.1.1.1.2.2.2, SS-JC-10002 3.2.1.1.1.8.2

Type: Unsigned Integer

Range: 0 to 32767

Default: 0

Comments:

UNCLASSIFIED
FOR OFFICIAL USE ONLY

Appendix A

Field ACCESS DESCRIPTION

Identifier: AP082
Ref.: SS-JC-10002 Adaptable Parameter "Access description";
SS-JC-10002 3.2.1.1.1.8.2.e
Type: Coded
Values:

Value	Meaning
0	Contention Access 1/48 sec
1	Contention Access 1/24 sec
2	Contention Access 3/48 sec
3	Contention Access 1/12 sec
4	Contention Access 3/24 sec
5	Contention Access 2/12 sec
6	Contention Access 3/12 sec
7	Contention Access 4/12 sec
8	Contention Access 6/12 sec
9	Contention Access 8/12 sec
10	Contention Access 12/12 sec
11	Contention Access 16/12 sec
12	Contention Access 20/12 sec
13	Contention Access 26/12 sec
14	Contention Access 32/12 sec
15	Contention Access 64/12 sec
16	Dedicated Access Mode
17	Time Slot Reallocation
18	TSR Initial Entry
19-63	Not Used

Default: 16

Comments:

1. If the TRANSMIT/RECEIVE INDICATOR T/R field is 0 (Receive), this field must be set to 16 (Dedicated Access).
2. All transmit Time Slot Assignment Blocks with the same PG require the same Access Description, except for PGs that employ TSR as described below).
3. Transmit Time Slot Assignment Blocks for a PG that employs a TSR Pool can have a mixture of Access Description 16, 17, and 18 assignments (no more than three Access Description 17 blocks per PG and a limit of only one Access Description 18 block per PG).

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

4. If the PG INDEX NUMBER is 1, 2, 3, 12 or 13 then Access Descriptions 17 and 18 are Illegal.
5. A time slot assignment block with this field set to contention access, must be deleted before it is modified to be a time slot assignment block with this field set to dedicated.

Field NUMBER of RECEPTIONS (NR)

Identifier: AP548

Ref.: SS-JC-10002 Adaptable Parameter "Number of messages to receive";
SS-JC-10002 3.2.1.1.1.8.5.f

Type: Coded

Values:

Value	Meaning
0	Receive up to four arriving
1	Receive the first arriving
2	Receive up to two arriving
3	Receive up to three arriving

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Default: 0

Comments: Defines the number of messages the terminal will set to receive in accordance with adaptable parameters of the assignment. During the explicit block and in the time slot indicated by AP085, relay delay receive, the terminal will set to receive a number of messages as indicated except for PGs 2, 3, 12 and 13. For these PGs, the Link 16 Waveform will only attempt to receive one message. If the AP is set to a value other than 1 for slot assignments with PG 2, 3, 12 or 13, the Link 16 Waveform will overwrite the AP to a value of 1 and accept the assignments.

For a transmit assignment in common with receive assignment(s) or relay receive assignment(s) and share the same pseudorandom sequence, the number of receptions field (AP548 or AP549) must be the same.

For a paired slot relay assignment where the transmit portion in common with receive assignment(s) or the receive portion of other paired slot relay assignment(s) and share the same pseudorandom sequence, the number of receptions field (AP548 or AP549) must be the same.

Field RELAY DELAY SWITCH (RDS)

Identifier: AP083

Ref.: SS-JC-10002 Adaptable Parameter "Relay delay switch (RDS)"
SS-JC-10002 3.2.1.1.1.4.5 & 3.2.1.1.1.8.2.a.2

Type: Coded

Values:

Value	Meaning
0	Bits 0-6 of this word contain the Relay Delay, Receive field
1	Bits 0-6 of this word contain the End-to-End Relay Delay field

Default: 0

Comments: RDS = 1 is valid only when the TRANSMIT/RECEIVE INDICATOR (T/R) field is 0 (Receive) and the CRYPTO MODE field is 1 for Partitioned Variable Mode (PVM).

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field RELAY NET NUMBER

Identifier: AP084

Ref.: SS-JC-10002 Adaptable Parameter "Relay net number"
SS-JC-10002 3.2.1.1.1.8.2.c & 3.2.1.1.1.8.5.b & 3.2.1.1.1.8.6.2

Type: Unsigned Integer

Range: 0 to 127

Default: 0

Comments: When the RDS field is 0 and the RELAY DELAY, RECEIVE field is 0, this field is not used.

When the RDS field is 0 and the RELAY DELAY, RECEIVE field is 6 to 31 the RELAY NET NUMBER is used as follows:

- 127 is illegal unless it is a voice A, voice B or Control,
- if Voice A, Voice B or Control and the Net is 127, use AP279, AP280 or AP281 appropriately.

If the PG INDEX NUMBER field (AP087) is the same as an entry (AP152) in Net Selection By PG Words 1-8, A.4.4.41, then this field shall be consistent with all net number fields in all time slot assignment blocks belonging to this PG. Those fields include AP078, AP084, AP086, AP093, AP101 and AP103, as well as AP151. If AP151 equals 127, then the net number (AP078 or AP093) in the first paired PG relay assignment or non-relay time slot assignment for the PG shall be used for all net numbers, including the net number for the PG in the net selection status.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field RELAY DELAY, RECEIVE / END-TO-END RELAY DELAY

Identifier: AP085
Ref.: SS-JC-10002 Adaptable Parameter "Relay delay"
SS-JC-10002 3.2.1.1.1.4.5, 3.2.1.1.1.8.2.a.2 & 3.2.1.1.1.8.5.b
Type: Unsigned Integer
Range/Units: 6 to 127 slots
Default: 6
Comments: When the RDS field is 0, this field contains the Relay Delay, Receive
0 = No Statement
1 to 5 = Illegal
6 to 31 = Assigned Number of Delay Slots
32 to 127 = Illegal.
When the RDS field is 1, this field contains the End-to-End Relay Delay
0 to 5 = Illegal
6 to 127 = Assigned Number of Delay Slots.

Field ORIGINAL TRANSMIT NET

Identifier: AP086
Ref.: SS-JC-10002 Adaptable Parameter "Original transmit net"
SS-JC-10002 3.2.1.1.1.4.5 & 3.2.1.1.1.8.6.2.a
Type: Unsigned Integer
Range: 0 to 127
Default: 0
Comments: Valid only when the RDS field is 1.
If the PG INDEX NUMBER field (AP087) is 9 (Control), 12 (Voice A), or 13 (Voice B) then the value 127 means "use channel Net Number" (AP281, AP280 or AP279 respectively), otherwise the value 127 is Illegal.
If the PG INDEX NUMBER field is the same as an entry (AP152) in Net Selection By PG Words 1-8, A.4.4.41, then this field shall be consistent with all net number fields in all time slot assignment blocks belonging to this PG. Those fields include AP078, AP084, AP086, AP093, AP101 and AP103, as well as AP151. If AP151 equals 127, then the net number (AP078 or AP093) in the first paired PG relay assignment or non-relay time slot assignment for the PG shall be used for all net numbers, including the net number for the PG in the net selection status.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field PG INDEX NUMBER

Identifier: AP087
Ref.: SS-JC-10002 Adaptable Parameter "PG index number";
SS-JC-10002 3.2.1.1.1.8.2.b & d
Type: Unsigned Integer
Range: 0 to 511
(0 = No Statement)
Default: 0
Comments:

Field TRANSEC CVLL

Identifier: AP088
Ref.: SS-JC-10002 Adaptable Parameter "TRANSEC CVLL";
SS-JC-10002 3.2.1.1.1.4.6.4 & 3.2.1.1.1.8.2.c & 3.2.1.1.1.8.6.2.f.1(a-c) &
3.2.1.1.1.8.6.2.c
Type: Unsigned Integer
Range: 0 to 127
(0 = Illegal)
Default: 1
Comments: Transmission Security Variable Label.
If the PG INDEX NUMBER field (AP087) is the same as the index number for either variable definition net selection PG (A.4.4.50), this variable may be replaced by a CVLL (AP492) as defined in SS-JC-10002 3.2.1.1.1.8.6.2.f.1 (a-c) & 3.2.1.1.1.8.6.2.c and section (A.4.4.50) of this System/Segment Interface Control Document Appendix A.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field MSEC CVLL

Identifier: AP089

Ref.: SS-JC-10002 Adaptable Parameter "MSEC CVLL";
SS-JC-10002 3.2.1.1.1.4.6.4 & 3.2.1.1.1.8.6.2.f.1 (a-c) & 3.2.1.1.1.8.6.2.c

Type: Unsigned Integer

Range: 0 to 127
(0 = No Statement)

Default: 1

Comments: Message Security (MSEC) Variable Label.
When the CRYPTO MODE (CM) field is 0 for Common Variable Mode (CVM), MSEC CVLL must equal TRANSEC CVLL.
When the CRYPTO MODE (CM) field is 1 (PVM) and the PG INDEX NUMBER is 9, 12, or 13 the Terminal does not check input MSEC CVLL variables.
If the PG INDEX NUMBER field (AP087) is the same as the index number for either variable definition net selection PG (A.4.4.50) this variable may be replaced by a CVLL (AP492) as defined in SS-JC-10002 3.2.1.1.1.8.6.2.f.1 (a-c) & 3.2.1.1.1.8.6.2.c and section (A.4.4.50) of this *System/Segment Interface Control Document Appendix A*.

Field RELAY INDICATOR (RS)

Identifier: AP075

Ref.: SS-JC-10002 Adaptable Parameter "Relay indicator"
SS-JC-10002 3.2.1.1.1.8.2

Type: Coded

Values:

Value	Meaning
0	Non-Relay Time Slot Assignment
1	Relay Time Slot Assignment

Default: 0

Comments: This field is used to switch layout for Time Slot Assignment blocks.
This bit must be set to Logic 1 for a Relay Time Slot Assignment.

Field CRYPTO MODE (CM)

Identifier: AP091

Ref.: SS-JC-10002 Adaptable Parameter "Crypto mode";
SS-JC-10002 3.2.1.1.1.4.5 & 3.2.1.1.1.8.6.2.e.3

Type: Coded

Values:

Value	Meaning
0	Common Variable Mode
1	Partitioned Variable Mode

Default: N/A since RS field default value is 0

Comments: If the PG INDEX NUMBER field (AP104) is the same as the index number for either variable definition net selection PG (A.4.4.50), this variable may be replaced by the Original CryptoMode (AP493/494) as defined in SS-JC-10002 3.2.1.1.1.8.6.2.e and section (A.4.4.50) of this *System/Segment Interface Control Document Appendix A*.

Field RECURRENCE RATE

Identifier: AP092
Ref.: SS-JC-10002 Adaptable Parameter "Recurrence rate";
SS-JC-10002 3.2.1.1.1.8.2
Type: Unsigned Integer
Range: 2 to 15
(0,1 = Illegal)
Default: N/A since RS field default value is 0
Comments:

Field NET NUMBER (RECEIVE)

Identifier: AP093
Ref.: SS-JC-10002 Adaptable Parameter "Net number (receive)";
SS-JC-10002 3.2.1.1.1.4.6.6 & 3.2.1.1.1.8.2.c & 3.2.1.1.1.8.6.2.a
Type: Unsigned Integer
Range: 0 to 127
(127 = No Statement)
Default: N/A since RS field default value is 0
Comments: Defines the receive net number to be used for this Time Slot Assignment Block. If the PG INDEX NUMBER field (AP104) is 9 (Control), 12 (Voice A), or 13 (Voice B) then the value 127 means "use channel Net Number" (AP281, AP280 or AP279 respectively), otherwise the value 127 is illegal.
If the PG INDEX NUMBER field is the same as an entry (AP152) in Net Selection By PG Words 1-8, A.4.4.41, then this field shall be consistent with all net number fields in all time slot assignment blocks belonging to this PG. Those fields include AP078, AP084, AP086, AP093, AP101 and AP103, as well as AP151. If AP151 equals 127, then the net number (AP078 or AP093) in the first paired PG relay assignment or non-relay time slot assignment for the PG shall be used for all net numbers, including the net number for the PG in the net selection status.

Appendix A

Field SET

Identifier: AP094

Ref.: SS-JC-10002 Adaptable Parameter "Set";
SS-JC-10002 3.2.1.1.1.2.2.2, SS-JC-10002 3.2.1.1.1.8.2

Type: Coded

Values:

Value	Meaning
0	No Statement (Delete Block)
1	Set A
2	Set B
3	Set C

Default: N/A since RS field default value is 0

Comments: Time slot Set for this Time Slot Assignment Block.
If SET is set to "0" all fields in Time Slot Assignment block are "don't care" for validity purpose.

Field CRYPTO NET RELAY (CNR)

Identifier: AP095

Ref.: SS-JC-10002 Adaptable Parameter "Cryptonet relay"
SS-JC-10002 3.2.1.1.1.4.5

Type: Boolean

Values: Logic 1 = Use Crypto Net Relay
Logic 0 = Do not use Crypto Net Relay

Default: N/A since RS field default value is 0

Comments: Valid only when the CRYPTO MODE (CM) field is 0 (CVM).

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field INDEX NUMBER

Identifier: AP096
Ref.: SS-JC-10002 Adaptable Parameter "Index number";
SS-JC-10002 3.2.1.1.1.2.2.2, SS-JC-10002 3.2.1.1.1.8.2
Type: Unsigned Integer
Range: 0 to 32767
Default: N/A since RS field default value is 0
Comments:

Field RELAY DELAY

Identifier: AP097
Ref.: SS-JC-10002 Adaptable Parameter "Relay delay";
SS-JC-10002 3.2.1.1.1.8.2.a.2
Type: Unsigned Integer
Range/Units: 6 to 31 slots
(0 to 5 = Illegal)
Default: N/A since RS field default value is 0
Comments: The number of delay slots between reception and transmission.

Field RELAY FUNCTION

Identifier: AP098
Ref.: SS-JC-10002 Adaptable Parameter "Relay function";
SS-JC-10002 3.2.1.1.1.8.4.3.2 to 3.2.1.1.1.8.4.4.5
Type: Coded
Values:

Value	Meaning
0	Main Net Relay
1	Voice Net Relay
2	Control Net Relay
3	Zoom Relay
4	Directed Relay
5	Message Directed MDR=0
6	Message Directed MDR=1
7	Participation Group Relay

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Default: N/A since RS field default value is 0

Comments:

Field RELAY CONTROL (RC)

Identifier: AP099

Ref.: SS-JC-10002 Adaptable Parameter "Relay control";
SS-JC-10002 3.2.1.1.1.8.2.e & 3.2.1.1.1.8.4

Type: Coded

Values:

Value	Meaning
0	No Statement
1	Suspended
2	Conditional
3	Unconditional

Default: N/A since RS field default value is 0

Comments: A "Suspended" relay is inactive for both receive and transmit. The Terminal will receive on the default net using the default cryptovars for suspended relay receive and relay transmit slots (AP037 DEFAULT NET NUMBER and AP038 DEFAULT TRANSEC) if there are no other slot assignments overlapping with the suspended relay assignment for that time slot. If there are other slot assignments that overlap with the suspended relay assignment, then the Terminal will receive data only from the overlapping slots for that time slot. "Conditional" and "Unconditional" refer to transmit operation only. Relay Inhibit (AP355) affects only message transmission, that is all transmission and retransmission in all relay modes. Receive functions are unaffected and in accordance with parameters in the Relay Time Slot Assignment Blocks.

Field NUMBER of RECEPTIONS (NR)

Identifier: AP549

Ref.: SS-JC-10002 Adaptable Parameter "Number of Receptions";
SS-JC-10002 3.2.1.1.1.8.5.f

Type: Coded

Values:

Value	Meaning
-------	---------

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
0	Receive up to four arriving
1	Receive the first arriving
2	Receive up to two arriving
3	Receive up to three arriving

Default: 0

Comments: Defines the number of messages the terminal will set to receive in accordance with adaptable parameters of the assignment. During the explicit relay receive time slot block the terminal will set to receive a number of messages as indicated. When not relay transmitting the terminal will set to receive a number of messages as indicated except for PGs 12 and 13 (voice relay). For these PGs, the Link 16 Waveform will only attempt to receive one message. If the AP is set to a value other than 1 for PGs 12 or 13, the Link 16 Waveform will overwrite this to a 1.

For a transmit assignment in common with receive assignment(s) or relay receive assignment(s) and share the same pseudorandom sequence, the number of receptions field (AP548 or AP549) must be the same.

For a paired slot relay assignment where the transmit portion in common with receive assignment(s) or the receive portion of other paired slot relay assignment(s) and share the same pseudorandom sequence, the number of receptions field (AP548 or AP549) must be the same.

Field DO NOT DECRYPT (DND)

Identifier: AP100

Ref.: SS-JC-10002 Adaptable Parameter "Do not decrypt";
SS-JC-10002 3.2.1.1.1.4.6

Type: Boolean

Values: Logic 1 = Do not attempt to decrypt relayed messages
Logic 0 = Attempt to decrypt relayed messages

Default: N/A since RS field default value is 0

Comments: Valid only when the CRYPTO MODE (CM) field is 1 (PVM).

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field ORIGINAL TRANSMIT NET

Identifier: AP101
Ref.: SS-JC-10002 Adaptable Parameter "Original transmit net"
SS-JC-10002 3.2.1.1.1.4.5 & 3.2.1.1.1.8.6.2.a
Type: Unsigned Integer
Range: 0 to 127
Default: N/A since RS field default value is 0
Comments: Valid only when the CRYPTO MODE (CM) field is 1 (PVM). If the PG INDEX NUMBER field (AP104) is 9 (Control), 12 (Voice A), or 13 (Voice B) then the value 127 means "use channel Net Number" (AP281, AP280 or AP279 respectively), otherwise the value 127 is illegal.
If the PG INDEX NUMBER field is the same as an entry (AP152) in Net Selection By PG Words 1-8, A.4.4.41 , then this field shall be consistent with all net number fields in all time slot assignment blocks belonging to this PG. Those fields include AP078, AP084, AP086, AP093, AP101 and AP103, as well as AP151. If AP151 equals 127, then the net number (AP078 or AP093) in the first paired PG relay assignment or non-relay time slot assignment for the PG shall be used for all net numbers, including the net number for the PG in the net selection status.

Field END-TO-END RELAY DELAY

Identifier: AP102
Ref.: SS-JC-10002 Adaptable Parameter "End-to-end delay"
SS-JC-10002 3.2.1.1.1.4.5
Type: Unsigned Integer
Range/Units: 0 slot = legal
1 to 5 = illegal
6 to 127 slots = legal
Default: N/A
Comments: Valid only when the CRYPTO MODE (CM) field is 1 (PVM).

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field NET NUMBER (TRANSMIT)

Identifier: AP103

Ref.: SS-JC-10002 Adaptable Parameter "Net number (transmit)"
SS-JC-10002 3.2.1.1.1.4.6.6 & 3.2.1.1.1.8.2.c & 3.2.1.1.1.8.6.2.a

Type: Unsigned Integer

Range: 0 to 127

Default: N/A since RS field default value is 0

Comments: Defines the transmit net number to be used for the relay transmit slot of this assignment block. If the PG INDEX NUMBER field (AP104) is 9 (Control), 12 (Voice A), or 13 (Voice B) then the value 127 means "use the channel Net Number" (AP279, AP280, AP281), otherwise the value 127 is Illegal.

If the PG INDEX NUMBER field is the same as an entry (AP152) in Net Selection By PG Words 1-8, A.4.4.41, then this field shall be consistent with all net number fields in all time slot assignment blocks belonging to this PG. Those fields include AP078, AP084, AP086, AP093, AP101 and AP103, as well as AP151. If AP151 equals 127, then the net number (AP078 or AP093) in the first paired PG relay assignment or non-relay time slot assignment for the PG shall be used for all net numbers, including the net number for the PG in the net selection status.

Field PG INDEX NUMBER

Identifier: AP104

Ref.: SS-JC-10002 Adaptable Parameter "PG index number";
SS-JC-10002 3.2.1.1.1.8.2.b & d

Type: Unsigned Integer

Range: 0 to 511
(0 = No Statement)

Default: N/A since RS field default value is 0

Comments: The entry in this field depends on the RELAY FUNCTION selected in Time Slot Assignment Block word III as follows:

RELAY FUNCTION	PG INDEX NUMBER
0	0 - 511
1	12 for Voice A 13 for Voice B
2	9

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

RELAY FUNCTION	PG INDEX NUMBER
3	0 - 511
4	Applicable Group Number (0 - 63)
5	0 - 511
6	0 - 511
7	4-8, 10, 11, 14-511 (1)

⁽¹⁾ PG values 9, 12 and 13 not a mandatory requirement for this relay function.

Field TRANSEC CVLL

Identifier: AP105

Ref.: SS-JC-10002 Adaptable Parameter "TRANSEC CVLL";
SS-JC-10002 3.2.1.1.1.4.6.4 & 3.2.1.1.1.8.2.c & 3.2.1.1.1.8.6.2.f.1 (a-c) &
3.2.1.1.1.8.6.2.c

Type: Unsigned Integer

Range: 0 to 127
(0 = Illegal)

Default: N/A since RS field default value is 0

Comments: Transmission Security Variable Label.

If the PG INDEX NUMBER field (AP104) is the same as the index number for either variable definition net selection PG (A.4.4.50), this variable may be replaced by a CVLL (AP492) as defined in SS-JC-10002 3.2.1.1.1.8.6.2.f.1 (a-c), 3.2.1.1.1.8.6.2.c and section (A.4.4.50) of this *System/Segment Interface Control Document Appendix A*.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field MSEC CVLL

Identifier: AP106

Ref.: SS-JC-10002 Adaptable Parameter "MSEC CVLL";
SS-JC-10002 3.2.1.1.1.4.6.4 & 3.2.1.1.1.8.2.c & 3.2.1.1.1.8.6.2.f.1 (a-c) &
3.2.1.1.1.8.6.2.c

Type: Unsigned Integer

Range: 0 to 127
(0 = No Statement)

Default: N/A since RS field default value is 0

Comments: Message Security Variable Label.
When the CRYPTO MODE (CM) field is 0 and the CRYPTO NET RELAY (CNR) field is 0, MSEC CVLL must equal TRANSEC CVLL.
When the CRYPTO MODE (CM) field is 0 and the CRYPTO NET RELAY (CNR) field is 1, MSEC CVLL = 0 is Illegal.
When the CRYPTO MODE (CM) field is 1 and DO NOT DECRYPT (DND) field is 0, MSEC CVLL = 0 is Illegal.
When the CRYPTO MODE (CM) field is 1 and DO NOT DECRYPT (DND) field is 1, MSEC CVLL is a "don't care."
If the PG INDEX NUMBER field (AP104) is the same as the index number for either variable definition net selection PG (A.4.4.50) this variable may be replaced by a CVLL (AP492) as defined in SS-JC-10002 3.2.1.1.1.8.6.2.f.1 (a-c), 3.2.1.1.1.8.6.2.c and section (A.4.4.50) of this *System/Segment Interface Control Document Appendix A*.

A.4.5 Reserved

A.4.6 Maintenance parameters

The Link 16 Waveform will not utilize Maintenance Parameters (MPs) as the MIDS LVT. Instead MPs 111, 113, 156, 157, and 158 will be processed as adaptable parameters AP600-AP604. The remaining maintenance parameters will be processed as variable parameters.

A.5 Status data

The status data file contains all the Terminal status data and built in test results the Terminal is required to provide to the Host or which is useful for test purposes.

This section defines the status data file format and content.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

A.5.1 Status data file format

The status data file is organized in 16-bit words numbered sequentially from 1 as depicted in FIGURE A-5.

The status words contained in each 16-bit word of the status data file are presented in A.5.3.

FIGURE A-5. Status data file format

A.5.2 Status data exchange

Terminal status data can be provided to the Host periodically, by means of dedicated FOMs, or upon request from the Host.

Status data will be provided to the Host by means of the Initialization & Status Data Response FOM (FOM04) upon reception of the Init & Status Data Request FIM (FIM02) requesting status data.

A.5.3 Status data file content

This section contains a detailed description of the status data file. Status data are grouped in segments of words on a functional basis, taking into account the different rates at which they are to be provided to the Host. FIGURE A-5 provides a brief description of the content of each segment.

TABLE A-LXXXII to TABLE A-CXL describe the content of each word of the Status Data File. A detailed description of each status data word is given in subsequent sections.

Status words are described individually or in functionally cohesive groups.

All Status File Words except for the BIT logging record words and EMC Protection Status words are cleared at start-up.

Field TACAN Standalone Initialization State (TAC STND INIT)

Word#1 Bits#0-1

Ref.: Volume I A.4.3

Type: Coded

Values:

Value	Meaning
0	Reserved
1	TACAN Standalone Awaiting Load
2	TACAN Standalone Load Complete
3	TACAN Standalone transitioned to Run Mode

Comments: Refer to Current Initialization Status for Init State.

Field TACAN Standalone Operation State (TAC STND RDY)
Word#1 Bit#2

Ref.: Volume I A.4.3

Type: Boolean

Values: Logic 0 = TACAN Standalone Not Operational
Logic 1 = TACAN Standalone Operational and Ready

Comments:

Field TACAN ONLY (TAC ONLY)

Word#1 Bit#3

Ref.: SS-JC-10001 3.2.1.18.8.3, Volume I A.4.3.4

Type: Boolean

Values: Logic 1 = MIDS JTRS Terminal is in TACAN Only mode, the Link 16 Waveform is not running
Logic 0 = Link 16 Waveform has been successfully instantiated and started

Comments: The setting of AP004 does not affect this bit.

Field ELAPSED TIME INDICATOR (ETI)

Word#1 Bit#4

Ref.: SS-JC-10001 3.2.5.2

Type: Boolean

Values: Logic 1 = Elapsed Time Indicator Failure
Logic 0 = No Failure

Comments:

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -

Field THERMAL OVERLOAD (TOL)

Word#1 Bit#5

Ref.: SS-JC-10001 3.2.1.26.4 k, SS-JC-10002 3.2.3.1.1.3.1

Type: Boolean

Values: Logic 1 = Thermal Overload
Logic 0 = No Thermal Overload

Comments:

Field NETWORK/COMMUNICATION DEGRADED PERFORMANCE (NET DP)

Word#1 Bit#6

Ref.: SS-JC-10001 3.2.1.26.4.m, SS-JC-10002 3.2.5.2.6.2

Type: Boolean

Values: Logic 0 = No Degraded performance
Logic 1 = Degraded Performance

Comments:

Field TDMA TRANSMIT DEGRADED PERFORMANCE (TDMA TX DP)

Word#1 Bit#7

Ref.: SS-JC-10002 3.2.5.2.6.2

Type: Boolean

Values: Logic 0 = No Degraded performance
Logic 1 = Degraded Performance

Comments:

Field TDMA TRANSMIT FAIL (TDMA TX FAIL)

Word#1 Bit#8

Ref.: SS-JC-10002 3.2.5.2.6.2

Type: Boolean

Values: Logic 0 = No Failure
Logic 1 = Set when there is a failure condition

Comments:

Field TDMA RECEIVE DEGRADED PERFORMANCE (TDMA RX DP)

Word#1 Bit#9

Ref.: SS-JC-10002 3.2.5.2.6.2

Type: Boolean

Values: Logic 0 = No Degraded performance
Logic 1 = Degraded Performance

Comments:

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field TDMA RECEIVE FAIL (TDMA RX FAIL)

Word#1 Bit#10

Ref.: SS-JC-10002 3.2.5.2.6.2
Type: Boolean
Values: Logic 0 = No Failure
Logic 1 = Set when there is a failure condition
Comments:

Field IPF FAIL (IPFF)

Word#1 Bit#11

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1
Type: Boolean
Values: Logic 1 = IPF Fail
Logic 0 = No IPF Fail
Comments:

Field NO KEYS LOADED (NKL)

Word#1 Bit#12

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1
Type: Boolean
Values: Logic 0 = Link 16 Key(s) loaded
Logic 1 = No Link 16 Key(s) loaded
Comments: This bit will be set if no Link 16 keys are present. This field is valid if Link 16 Ready = 1.

Field TERMINAL FAIL (TF)

Word#1 Bit#13

Ref.: SS-JC-10001 3.2.1.26.4.q, SS-JC-10002 3.2.5.2.6.2.1.g.4, SS-JC-10003 3.2.5.1.1.2.b.3
Type: Boolean
Values: Logic 1 = Terminal Fail
Logic 0 = No Terminal Fail
Comments: This bit is set when any BIT mode has detected a failure condition within the Terminal.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field TEST GO (TG)

Word#1 Bit#14

Ref.: SS-JC-10002 3.2.5.2.6.1
SS-JC-10002 3.2.5.2.6.3
Type: Boolean
Values: Logic 1 = Start-up or Manually Initiated BIT completed and all tests passed
Logic 0 = Start-up or Manually Initiated BIT completed and all tests NOT passed
Comments: When this bit is set to zero, the Host may request Status Words 31-60.

Field ETR NOT RECEIVED (ETR NR)

Word#1 Bit#15

Ref.: SS-JC-10002 3.2.1.1.1.5.3.2
Type: Boolean
Values: Logic 1 = Data from ETR not received
Logic 0 = Data from ETR received
Comments: This bit is set to one when the Terminal has been initialized to use an ETR, and is not receiving data from the ETR.

Field OVER THE AIR REKEYING SUCCESSFUL (OTAR)

Word#2 Bit#0

Ref.: SS-JC-10002 3.2.1.1.1.13
Type: Boolean
Values: Logic 1 = Over the Air Rekeying successfully Completed
Logic 0 = No Statement
Comments: This indication is also given in response to OTAR commands received from the Host through FIM01, Common Carrier FIM. When the AP018 REKEYING PROCESSING STATUS is 0 (Off), this field is meaningless.

Field BIT STATUS

Word#2 Bits#1-2

Ref.: SS-JC-10001 3.2.1.26.3, SS-JC-10002 3.2.5.2.6.3
Type: Coded
Values:

Value	Meaning
0	BIT completed
1	Not used
2	Not used
3	BIT in process

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Comments: This field indicates the status of the start-up or the manually initiated BIT. The "BIT completed value" will remain until another IBIT is commanded.

Field NAVIGATION RESET CONFIRMED (NR)

Word#2 Bit#3

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1

Type: Boolean

Values: Logic 1 = Navigation Reset Confirmed
Logic 0 = No Statement

Comments: This bit indicates that the Terminal Kalman Filter (KF) has been reset for internal or external reasons.

Field RECORDING BUFFER OVERFLOW (RBO)

Word#2 Bit#4

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1

Type: Boolean

Values: Logic 1 = Recording Buffer Overflow
Logic 0 = Recording Buffer Normal Operation

Comments: When this bit is set to Logic 1, it means that the storage capacity of the recording function either over the support or over the databus, depending on the selection performed by the host (AP024), has overflowed. The host should modify the recording parameters to avoid the overflow.

Field INITIALIZATION SETS STATE

Word#2 Bits#5-6

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f

Type: Coded

Values:

Value	Meaning
0	No Statement
1	Set Validity Test In Progress
2	Set Validity Test Complete - Valid Data
3	Set Validity Test Complete - Data Conflict or Set Rejected

Comments: Status of validity checking for the initialization data sets. The status values are described in detail in A.4.2.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field NET ENTRY STATUS

Word#2 Bits#7-9

Ref.: SS-JC-10002 3.2.1.1.1.5.5.2;
SS-JC-10002 3.2.1.1.1.5.5.3
Type: Coded
Values:

Value	Meaning
0	Net Entry Has Not Begun
1	Net Entry in Progress
2	Coarse Synchronization Confirmed
3	Fine Synchronization Achieved
4	Coarse Synchronization Achieved
5-7	Not Used

Comments:

Field CURRENT INITIALIZATION STATE

Word#2 Bits#11-13

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1
Type: Coded
Values:

Value	Meaning
0	No Statement
1	Awaiting Load
2	Load In Progress
3	Load Complete, Validity Test In Progress
4	Load Complete, Valid Data
5	Load Complete, Segment Count Error
6	Load Complete, Data Conflict
7	Not Used

Comments: Used to report status on the current initialization data.
The detailed description of these states is provided in A.4.2 of this document.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field Link 16 READY (L16 RDY)

Word#2 Bit# 14

Ref.: SS-JC-10002 3.2.5.6.2;
SS-JC-10002 3.2.1.1.1.20.1.1
Type: Boolean
Values: Logic 0 = Link 16 Waveform is not running
Logic 1 = Link 16 Waveform is running
Comments:

Field VOICE A CHANNEL STATUS (VASTAT)

Word#3 Bits#0-2

Field VOICE B CHANNEL STATUS (VBSTAT)

Word#3 Bits#3-5

Ref.: SS-JC-10002 3.2.1.1.1.16.5;
SS-JC-10002 3.2.1.1.1.16.6.1
Type: Coded
Values:

Value	Meaning
0	Operational
1	Net selected shutdown
2	BIT detected fault
3	No statement
4	Slot assignment not compatible with voice selection
5	Insufficient slots due to packing
6	Packing is greater than packing limit
7	Incompatible Voice Channelization Parameters

Comments:

Field VOICE INDICATORS PORT 1 (VIP1)

Word#3 Bits#6-7

Field VOICE INDICATORS PORT 2 (VIP2)

Word#3 Bits# 8-9

Ref.: SS-JC-10002 3.2.3.1.1.3.10
Type: Coded
Values:

Value	Meaning
0	Non Active (No Voice signals Received or Transmitted)
1	Voice signal is being transmitted

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
2	Voice signal is being received
3	Not used

Comments:

Field LONG TERM TRANSMIT INHIBIT (LTTI)

Word#3 Bit#10

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1;
SS-JC-10002 3.2.3.2.1

Type: Boolean

Values: Logic 1 = Transmission inhibit
Logic 0 = No statement

Comments: This bit will be set when the discrete LTTI or the Adaptable Parameter LTTI (AP383) are set.

Field CONTROL PG STATUS

Word#3 Bits#13-14

Ref.: SS-JC-10002 3.2.1.1.1.8.3.3.9

Type: Coded

Values:

Value	Meaning
0	Operational
1	Slot Assignment not compatible with selection
2	No time slot assignments
3	Not Used

- Comments:
1. The Control PG Status is set to 0 when Net selection is not 127 and there are TSAs with net 127 assigned to Control PG, or net selection is not 127 and there are TSAs with the same net number assigned to Control PG.
 2. The control PG Status is set to 1 by the Terminal when Net selection for control is not compatible with the TSAs (TSAs for Control have a net number different from 127 and different from the net selection)
 3. The Control PG status is set to 2 by the Terminal when there are no TSAs assigned to control in the current initialization data.
 4. The Control PG Status will be valid only when the channel is selected.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -

Field EXCESSIVE BLANKING (EXBLK)

Word#3 Bit#15

Ref.: SS-JC-10002 3.2.3.2.1.d

Type: Boolean

Values: Logic 0 = No Excessive blanking
Logic 1 = Excessive Blanking

Comments:

A.5.3.1.2 Ongoing BIT and status (words #4-30)

Field TACAN FAIL (TACANF)

Word#7 Bit#13

Ref.: SS-JC-10003 3.2.5.1.1.2.b.3
Type: Boolean
Values: Logic 1 = TACAN Fail
Logic 0 = TACAN Good
Comments:

Field TDMA RF DEGRADED (TDRFD)

Word#7 Bit#12

Ref.: SS-JC-10002 3.2.5.2.6.2, SS-JC-10001 3.2.1.26.4.o
Type: Boolean
Values: Logic 1 = Degraded
Logic 0 = Not Degraded
Comments:

Field TACAN RF DEGRADED (TARFD)

Word#7 Bit#11

Ref.: SS-JC-10003 3.2.5.1.1.2.b.2, SS-JC-10001 3.2.1.26.4.o
Type: Boolean
Values: Logic 1 = Degraded
Logic 0 = Not Degraded
Comments:

Field COMMUNICATIONS/NETWORK DEGRADED PERFORMANCE (NETDP) Word#7 Bit#9

Ref.: SS-JC-10002 3.2.5.2.6.2, SS-JC-10001 3.2.1.26.4.p
Type: Boolean
Values: Logic 1 = Communications or Network performance degraded
Logic 0 = No performance degradation
Comments: This bit is a duplicate of bit 6 of Word 1

Field SDU ALERT (SDUALERT)

Word#7 Bit#8

Ref.: SS-JC-10001 3.2.1.26.10
Type: Boolean
Values: Logic 1 = Any bit set in SDU Alert Word (Word 9)
Logic 0 = No SDU Alert
Comments:

Field IPF FAIL (IPFF)

Word#7 Bit#7

Ref.: SS-JC-10001 3.2.1.26.10, SS-JC-10002 3.2.1.1.1.22.2.d
Type: Boolean
Values: Logic 1 = IPF Fail
Logic 0 = IPF Good
Comments:

Field BATTERY FAIL (BATTF)

Word#7 Bit#6

Ref.: SS-JC-10001 3.2.1.26.10.2
Type: Boolean
Values: Logic 1 = Battery Fail
Logic 0 = Battery Good
Comments:

Field VOICE FAIL (VOICEF)

Word#7 Bit#5

Ref.: SS-JC-10002 3.2.5.2.6.2.1
Type: Boolean
Values: Logic 1 = Voice Function Fail
Logic 0 = Voice Function Good
Comments:

Field TRANSMIT ALARM (TXALARM)

Word#7 Bit#4

Ref.: SS-JC-10001 3.2.1.26.10
Type: Boolean
Values: Logic 1 = Alarm
Logic 0 = No Alarm
Comments: This bit will be set for any transmit failure or by a failure of the Host Interface Logic Test (Output), RTI-004.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field RECEIVE ALARM (RXALARM)

Word#7 Bit#3

Ref.: SS-JC-10001 3.2.1.26.10
Type: Boolean
Values: Logic 1 = Alarm
Logic 0 = No Alarm

Comments:

Field HPA INTERFACE ASSEMBLY (HIA) FAIL (HIAF)

Word#7 Bit#2

Ref.: SS-JC-10001 3.2.1.26.5
Type: Boolean
Values: Logic 1 = HIA Fail
Logic 0 = No Fail

Comments:

Field HPA FAIL (HPAF)

Word#7 Bit#1

Ref.: SS-JC-10001 3.2.1.26.10
Type: Boolean
Values: Logic 1 = HPA Fail
Logic 0 = No Fail

Comments:

FUNCTIONAL BIT SUMMARY WORD 2 (WORD #8)

Appendix A

Field MANUALLY INITIATED BIT TRANSMISSION SUPPRESSED (NOBITXMIT) Word#8 Bit#15

Ref.: SS-JC-10001 3.2.1.26.5
Type: Boolean
Values: Logic 1 = One or more transmissions were suppressed during most recent execution of IBIT
Logic 0 = No transmissions were suppressed during the last execution of IBIT
Comments:

Field HIA NOT DETECTED (HIANODET) Word#8 Bit#2

Ref.: SS-JC-10001 3.2.1.26.3
Type: Boolean
Values: Logic 1 = HIA not detected during Start-up (all tests fail)
Logic 0 = HIA present
Comments: If the Terminal detects that the HIA is not present (all Start-up tests fail) it will clear all HIA and HPA failure indicators and set the HIA NOT DETECTED bit.

Field HPA DEGRADED PERFORMANCE (HPADP) Word#8 Bit#1

Ref.: SS-JC-10001 3.2.1.26.10, SS-JC-10002 3.2.3.10
Type: Boolean
Values: Logic 1 = High Power Amplifier Group (HPAG) Degraded Performance
Logic 0 = No performance degradation
Comments:

Field RECEIVE ANTENNA SWITCH (RXANTSW) Word#8 Bit#0

Ref.: SS-JC-10001 3.2.1.26.10
Type: Boolean
Values: Logic 1 = Receive path reconfigured due to receive path failure
Logic 0 = No receive path reconfiguration in effect
Comments:

9	SPARE	RESERVED	VOLTAR	PARERR	SDUAL	RESERVED	MKNCP	NKNCP	MKCCP	NKCCP
---	-------	----------	--------	--------	-------	----------	-------	-------	-------	-------

Field SDU VOLTAGE TRANSIENT (VOLTAR)

Word#9 Bit#10

Ref.: SS-JC-10001 3.2.1.26
Type: Boolean
Values: Logic 1 = Voltage transient occurred
Logic 0 = No voltage transient

Comments:

Field SDU PARITY ERROR (PARERR)

Word#9 Bit#9

Ref.: SS-JC-10001 3.2.1.26
Type: Boolean
Values: Logic 1 = Parity error occurred during transfer of cryptovariable
Logic 0 = No parity error

Comments:

Field SDU ALARM (SDUAL)

Word#9 Bit#8

Ref.: SS-JC-10001 3.2.1.26
Type: Boolean
Values: Logic 1 = SDU Alarm
Logic 0 = No Alarm

Comments:

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field MISSING KEYS NEXT CRYPTO PERIOD (MKNCP)

Word#9 Bit#3

Ref.: SS-JC-10002 3.2.1.1.1.13.1

Type: Boolean

Values: Logic 1 = Some cryptovariables are not present for the next crypto period
Logic 0 = No Statement

Comments: If set to a logic 1, status words 1136-1143 indicate the CVLLs of the missing keys for the next cryptoperiod. If NKNCP is set to a 1, the terminal will set this bit to a 0.

Field NO KEYS NEXT CRYPTO PERIOD (NKNCP)

Word#9 Bit#2

Ref.: SS-JC-10002 3.2.1.1.1.13.1

Type: Boolean

Values: Logic 1 = No cryptovariables are present for the next crypto period
Logic 0 = No Statement

Comments: If set to a logic 1, status words 1136-1143 indicate the CVLLs of the missing keys for the next cryptoperiod. If set to logic 1 and NKCCP is set to logic 1, then the No Keys Loaded (NKL) bit will be set to logic 1.

Field MISSING KEYS CURRENT CRYPTO PERIOD (MKCCP)

Word#9 Bit#1

Ref.: SS-JC-10002 3.2.1.1.1.13.1

Type: Boolean

Values: Logic 1 = Some cryptovariables are not present for the current crypto period
Logic 0 = No Statement

Comments: If set to a logic 1, status words 1128-1135 indicate the CVLLs of the missing keys for the current cryptoperiod. If NKCCP is set to a 1, the terminal will set this bit to a 0.

Field NO KEYS CURRENT CRYPTO PERIOD (NKCCP)

Word#9 Bit#0

Ref.: SS-JC-10002 3.2.1.1.1.13.1

Type: Boolean

Values: Logic 1 = No cryptovariables are present for the current crypto period
Logic 0 = No Statement

Comments: If set to a logic 1, status words 1128-1135 indicate the CVLLs of the missing keys for the current cryptoperiod. If set to logic 1 and NKNCP is set to logic 1, then the No Keys Loaded (NKL) bit will be set to logic 1.

Field IPF RESTRICTIONS FAIL SUMMARY WORD

Word#10 Bits#15-0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word	R-T							COMMON		HPAG						
10	CTTF	MLLDF	MPWF	MSTHF	MLTHF	MOOBF	MIFFF	RRS	TSDF	SPARE	HLLDF	HPWF	HSTHF	HLTHF	HOOBF	HIFFF

Note: When transmitting in mixed power mode in an HPAG configuration where transmissions will be made using either the Radio Frequency Amplifier (RFA) Shop Replaceable Unit (SRU) of the RT LRU or the HPA, the amplifier selected for transmission will report IPF conditions. This word will reflect the most recent event. When an IPF shutdown occurs, this word will again reflect only the most recent event; events of more than one type may have contributed to the shutdown.

Field CAPABLE TO TRANSMIT FAIL (CTTF)

Word#10 Bit#15

Ref.: SS-JC-10002 3.2.1.1.1.22.5.1

Type: Boolean

Values: Logic 1 = Capability to transmit reported by the power amplifier (PA) when no transmission scheduled
Logic 0 = Good

Comments:

Field RT LRU 1030/1090 LOW LEVEL DETECTION (LLD) FAIL (MLLDF) Word#10 Bit#14

Ref.: SS-JC-10002 3.2.1.1.1.22.5.2

Type: Boolean

Values: Logic 1 = Fail (Low Level emissions in 1030/1090 MHz IFF Bands)
Logic 0 = Good

Comments:

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field RT LRU PULSE WIDTH FAIL (MPWF)

Word#10 Bit#13

Ref.: SS-JC-10002 3.2.1.1.1.22.5.3

Type: Boolean

Values: Logic 1 = Fail
Logic 0 = Good

Comments:

Field RT LRU SHORT TERM HISTOGRAM FAIL (MSTHF)

Word#10 Bit#12

Ref.: SS-JC-10002 3.2.1.1.1.22.5.4

Type: Boolean

Values: Logic 1 = Fail
Logic 0 = Good

Comments:

Field RT LRU LONG TERM HISTOGRAM FAIL (MLTHF)

Word#10 Bit#11

Ref.: SS-JC-10002 3.2.1.1.1.22.5.4

Type: Boolean

Values: Logic 1 = Fail
Logic 0 = Good

Comments:

Field RT LRU OUT OF BAND FREQUENCY FAIL (MOOBF)

Word#10 Bit#10

Ref.: SS-JC-10002 3.2.1.1.1.22.5.4

Type: Boolean

Values: Logic 1 = Fail (Transmissions detected on non-MIDS frequencies or missing pulse)
Logic 0 = Good

Comments:

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field RT LRU IFF FAIL (MIFFF)

Word#10 Bit#9

Ref.: SS-JC-10002 3.2.1.1.1.22.5.4
Type: Boolean
Values: Logic 1 = Fail (Transmissions detected on IFF frequencies)
Logic 0 = Good
Comments:

Field Repromulgation Relay STATUS (RRS)

Word#10 Bit#8

Ref.: SS-JC-10002 3.2.1.1.1.22.5.9.2.b & 3.2.5.2.6.2
Type: Boolean
Values: Logic 1 = Repromulgation Relay Operational BIT (OBIT) Fault Detected
Logic 0 = Repromulgation Relay OBIT Fault NOT Detected
Comments: The Link 16 Waveform will set this bit active (1) when one or more repromulgation relay OBIT tests have failed (Repromulgation Jitter calculation or Repromulgation Relay Loopback Fails). This bit is reset to inactive (0) when either the Jitter calculation test has passed or the start of each epoch subdivision if the Loopback fail test caused the fault.

Field TIME SLOT DUTY FACTOR FAIL (TSDF)

Word#10 Bit#7

Ref.: SS-JC-10001 3.2.1.26
Type: Boolean
Values: Logic 1 = Fail
Logic 0 = Good
Comments:

Field HPAG 1030/1090 LLD FAIL (HLLDF)

Word#10 Bit#5

Ref.: SS-JC-10002 3.2.1.1.1.22.5.2
Type: Boolean
Values: Logic 1 = Fail (Low Level emissions in 1030/1090 MHz IFF Bands)
Logic 0 = Good
Comments:

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field HPAG PULSE WIDTH FAIL (HPWF)

Word#10 Bit#4

Ref.: SS-JC-10002 3.2.1.1.1.22.5.3

Type: Boolean

Values: Logic 1 = Fail
Logic 0 = Good

Comments:

Field HPAG SHORT TERM HISTOGRAM FAIL (HSTHF)

Word#10 Bit#3

Ref.: SS-JC-10002 3.2.1.1.1.22.5.4

Type: Boolean

Values: Logic 1 = Fail
Logic 0 = Good

Comments:

Field HPAG LONG TERM HISTOGRAM FAIL (HLTHF)

Word#10 Bit#2

Ref.: SS-JC-10002 3.2.1.1.1.22.5.4

Type: Boolean

Values: Logic 1 = Fail
Logic 0 = Good

Comments:

Field HPAG OUT OF BAND FREQUENCY FAIL (HOOBF)

Word#10 Bit#1

Ref.: SS-JC-10002 3.2.1.1.1.22.5.4

Type: Boolean

Values: Logic 1 = Fail (Transmissions detected on non-MIDS frequencies or missing pulse)
Logic 0 = Good

Comments:

Field LLD SUPPRESSION STATUS (LLDSS)

Word#12 Bit#13

Ref.: SS-JC-10002 3.2.1.1.1.22.5.2
Type: Boolean
Values: Logic 1 = LLD Suppression Ignored
Logic 0 = LLD Suppression Not Ignored
Comments: The Link 16 Waveform will set this bit active (1) when it is ignoring the LLD Suppression count. This bit is reset to inactive (0) at the start of each epoch subdivision.

Field HPA EXCITER FAIL (HPAEXCF)

Word#12 Bit#12

Ref.: SS-JC-10001 3.2.1.26
Type: Boolean
Values: Logic 1 = Exciter output from RT LRU to HPA Fail
Logic 0 = No Fail
Comments: This bit is set if either the PA reports an HPA Output Pulse Fail (Diagnostic BIT Status File, Word 20, Bit 14) or the HPA reports an RF Continuous Phase Shift Modulation signal Not Detected by HPA Fail (Diagnostic BIT Status File, Word 24, Bit 12).

Field RT TDMA HARD POWER FAIL (RTDHPF)

Word#12 Bit#11

Ref.: SS-JC-10001 3.2.1.26
Type: Boolean
Values: Logic 1 = RT TDMA power output > 3 dB down
Logic 0 = RT TDMA power output not > 3 dB down
Comments:

Field HPAG HARD POWER FAIL (HTDHPF)

Word#12 Bit#10

Ref.: SS-JC-10001 3.2.1.26
Type: Boolean
Values: Logic 1 = HPAG power output > 3 dB down
Logic 0 = HPAG power output Not > 3 dB down
Comments:

Word#16 Bit#6

Ref.: SS-JC-10001 3.2.1.26.4.p, SS-JC-10002 3.2.5.2.6.2

Type: Boolean

Values: Logic 0 = No Failure
Logic 1 = Failure

Comments: This bit indicates a failure of the active bus as determined by a lack of expected activity.

Field MESSAGE NOT ACKNOWLEDGED (MNA)

Word#16 Bit#5

Ref.: SS-JC-10001 3.2.1.26

Type: Boolean

Values: Logic 1 = At least one message requiring acknowledgment was not acknowledged during the previous monitoring interval
Logic 0 = All messages acknowledged

Comments:

Field LOOPBACK TOA FAIL (LB TOA FAIL)

Word#16 Bit#4

Ref.: SS-JC-10002 3.2.5.2.6.2

Type: Boolean

Values: Logic 1 = Excessive Loopback TOA failures in previous interval
Logic 0 = Acceptable Loopback TOA failures in previous interval

Comments:

Field LOOPBACK FAIL (LPBK FAIL)

Word#16 Bit#3

Ref.: SS-JC-10002 3.2.5.2.6.2

Type: Boolean

Values: Logic 1 = Excessive Loopback failures in previous interval
Logic 0 = Acceptable Loopback failures in previous interval

Field RTT REPLY FAIL (RTT R FAIL)

Word#16 Bit#2

Ref.: SS-JC-10002 3.2.5.2.6.2
Type: Boolean
Values: Logic 1 = Excessive RTT Reply failures in previous interval
Logic 0 = Acceptable RTT Reply Failures in previous interval
Comments:

Field MESSAGE FAIL (MESS FAIL)

Word#16 Bit#1

Ref.: SS-JC-10002 3.2.5.2.6.2
Type: Boolean
Values: Logic 1 = No valid messages were received in the previous interval
Logic 0 = At least one valid message was received
Comments:

Field MESSAGE ERROR RATE FAIL (MER FAIL)

Word#16 Bit#0

Ref.: SS-JC-10001 3.2.1.26
Type: Boolean
Values: Logic 1 = Excessive Uncorrectable coded messages received
Logic 0 = Acceptable rate of uncorrectable coded messages
Comments:

Field NUMBER OF RECEIVED MESSAGES (NRM)

Word#17 Bits#15-0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
17	NUMBER OF RECEIVED MESSAGES (NRM)															

Ref.: SS-JC-10002 3.2.5.2.6.2.1
Type: Unsigned Integer
Range: 0 to 65535
Comments: This field contains the total number of message package structures received in the preceding 12 second monitoring interval. For a 12 second monitoring interval this number would not exceed 6144.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field NUMBER OF MESSAGES THAT ARE RECEIVED ERRONEOUS (NMER) Word#18 Bits#15-0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word	NUMBER OF MESSAGES THAT ARE RECEIVED ERRONEOUS (NMER)															
18																

Ref.: SS-JC-10002 3.2.1.1.1.2.14

Type: Unsigned Integer

Range: 0 to 65535

Comments: This field contains the total number of message package structures received in error in the previous 12 second monitoring interval. For a 12 second monitoring interval this number would not exceed 6144. The rate is defined as the number of transmissions received in error in the last 12 seconds. A message package structure is received in error if it is:

1. an uncoded free text message and has a Reed-Solomon (R-S) decode error errata count > 9 in the header
2. a free format (FF) message or a coded FT message with a Reed-Solomon decode errors errata count > 16 in any data block or with a Reed Solomon (R-S) decode error errata count > 9 in the header.

Field NUMBER OF RTT INTERROGATIONS TRANSMITTED (NRTTI) Word#19 Bits#15-0

Type: Unsigned Integer
Values: 0 - 65535
Comments: This field contains the total number of Out of Bounds Frequency events recorded by the Terminal since power-on.

Field HISTOGRAM EVENT COUNTER

Word#32 Bits#0-15

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
HISTOGRAM EVENT COUNTER															

Ref.: SS-JC-10002 3.2.1.1.1.22.5.4.d
Type: Unsigned Integer
Values: 0 - 65535
Comments: This field contains the total number of Short Term and Long Term Histogram events recorded by the Terminal since power-on.

Field IFF TRANSMISSION EVENT COUNTER

Word#33 Bits#0-15

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IFF TRANSMISSION EVENT COUNTER															

Ref.: SS-JC-10002 3.2.1.1.1.22.5.2.c
Type: Unsigned Integer
Values: 0 - 65535
Comments: This field contains the total number of IFF Transmission events recorded by the Terminal since power-on.

Field RT LRU ADDRESS

Word#34 Bits#11-15

Ref.: SS-JC-10001 3.2.1.18.2.1.2.1.1.1
Type: Unsigned Integer
Range: 0 to 31
(0 = No Statement)
Comments:

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field EQUIPMENT IDENTIFICATION (EQUIP IDENT)

Word#34 Bits#4-6

Ref.: SS-JC-10001 3.2.5.2

Type: Coded

Values:

Value	LRU
0	No Statement
1	RT
2	RT Battery replacement
3	Remote Power Supply
4	HPA Interface Adapter
5	HPA
6	AIU
7	Not Used

Comments: This field contains a code identifying the LRU experiencing the fault being reported. The value no statement indicates that FOM29 does not report an LRU isolated failure.

Field FAILURE COUNT

Word#34 Bits#0-3

Ref.: SS-JC-10001 3.2.5.2

Type: Unsigned Integer

Range: 0 to 15

Comments: This field is a wraparound counter used by the host system for duplication control. It is set to zero at start-up and incremented each time FOM29 is changed.

Field LRU/SRU INDICATOR (LRU/SRU)

Word#35 Bit#15

Ref.: SS-JC-10001 3.2.1.26.10

Type: Boolean

Values: Logic 0 = LRU level or no SRU isolation information
Logic 1 = SRU level

Comments: - LRU level: the Word 1's LRU/SRU 1 field contains the code for the failed LRU and the Word 1's SRU 2 and SRU 3 fields are set to zero.
- SRU level: the Word 1's LRU/SRU 1 field and the Word 1's SRU 2 and SRU 3 fields contain the code of the three most probable SRUs. If FOM29 is not reporting a failure isolated to an LRU/SRU, the whole Word 1 is set to zero.
This field will be set to Logic 0 in the TACAN Standalone mode.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -

Field LRU/SRU 1

Word#35 Bits#10-14

Field SRU 2

Word#35 Bits#5-9

Field SRU 3

Word#35 Bits#0-4

Ref.: SS-JC-10001 3.2.1.26.10

Type: Coded

Values:

Value	SRU	
	RT LRU	HPA
0	No Statement	
1	Red/IO	Top PA
2	PCP/CSS	Bottom PA
3	IPS	Power Supply
4	TACAN/BCP	Processor
5	2-2(2) XCVR	Waveform Generator
6	2-2(3) XCVR	Counter I/O
7	2-2(4) XCVR	Chassis
8	L16 XCVR	External
9	RFA	Not Used
10	Chassis	Not Used
11	Not Used	Not Used
12	Not Used	Not Used
13	External SRU	Not Used
14	HIA	Not Used
21	Battery	Not Used
31	External LRU	Not Used
15-20 22-30	Not Used	

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Comments: - Those fields contain the code for the three most probable SRUs when the LRU/SRU INDICATOR is set to SRU level.

- The field LRU/SRU 1 contains the code for the failed LRU other fields are zero when the INDICATOR is set to LRU level (See EQUIP IDENT field).

An External LRU applies in the case for which the algorithm points to a Power Supply problem which is outside of the MIDS box [e.g., is neither the MIDS IPS nor RPS]. An “External SRU” applies to various cases for which the algorithm considers that one of the possible reasons for the observed failure is a faulty power supply or faulty cable which are outside of the MIDS box.

This field will be set to Logic 0 in the TACAN Standalone mode.

Field ETI (RT LRU) Word#36 Bits#0-15

Ref.: SS-JC-10001 3.2.5.2

Type: Unsigned Integer

Range/Units: 16384 Hours. LSB = 15 minutes

Comments: This field is valid only for RT LRU fault report. This field will be set to Logic 0 in the TACAN Standalone mode.

Field RT LRU SERIAL NUMBER (LSB) Word#37 Bits#0-15

Ref.: SS-JC-10001 3.2.5.2

Type: Unsigned Integer

Range: 0 to 65535

Comments: This field contains the RT LRU serial number. This field will be set to Logic 0 in the TACAN Standalone mode.

Field LRU TYPE CODE Word#38 Bits#8-15

Ref.: SS-JC-10001 3.2.5.2

Type: Constant

Values: (00010111)₂

Comments: This field contains a fixed value that may be used by a host to identify the MIDS JTRS.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field LRU CONFIGURATION STATUS CODE

Word#38 Bits#0-7

Ref.: SS-JC-10001 3.2.5.2
Type: Unsigned Integer
Range: 0 to 255, 0 = No Statement
Comments: This field shall contain a value which represents the configuration status (A dash number) of the RT LRU hardware, i.e. the configuration of the equipment exclusive of any externally programmable Computer Software Configuration Items (CSCIs). This field will be set to Logic 0 in the TACAN Standalone mode.

Field SOFTWARE MODIFICATION STATUS CODE

Word#39 Bits#0-15

Ref.: SS-JC-10001 3.2.1.26.10.3
Type: Unsigned Integer
Range: 0 to 32767
Comments: This field contains a composite configuration identifier for the OE and Link 16 Waveform CSCIs. This field will be set to Logic 0 in the TACAN Standalone mode, or if the TACAN Waveform is running and the Link 16 Waveform is not running.

Field BIT IDENTIFICATION CODE (BIT IDENT)

Word#40 Bits#13-15

Ref.: SS-JC-10001 3.2.1.26.10
Type: Coded
Values:

Value	Meaning
0	No Failure detected
1	Start-up BIT detected Failure
2	Manually initiated BIT detected Failure
3	Not used
4	Operational BIT detected failure Steady State Failure
5	Operational BIT detected failure Repetitive Short Term Failure
6	Operational BIT detected failure Repetitive Long Term Failure
7	Operational BIT detected Short Term Failure

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Comments: This field defines which BIT mode detected or isolated the failure being reported. In TACAN Standalone mode all faults detected by OBIT will use a value of 4.
NOTE: This field has no meaning when the field BIT STATUS indicates BIT in process.

Field FAILURE IDENTIFICATION CODE

Word#40 Bits#0-12

Ref.: SS-JC-10001 3.2.1.26.2.a

Type: Coded

Values:

VALUE	DESCRIPTION
0400 ₁₆	HPA Fail
0401 ₁₆ - 1FFF ₁₆	Reserved

Comments: This field contains a code identifying the specific failure being reported. If multiple failure identification codes occur, the Terminal will generate multiple FOM29s (one for failure identification code).

NOTE: This field has no meaning when the field BIT STATUS indicates Bn process.

Field TIME OF OCCURENCE

Word#41 Bits#0-15

Ref.: SS-JC-10001 3.2.1.26.10

Type: Coded

Values: Please refer to A.9.6.1 of Volume III.

Comments: This field contains the time at which the failure report was generated and represents the LSB of MIDS TIME TAG of each Platform.

Note: Only applicable to platform types A and L.

Field RT LRU FAIL

Word#42 Bit#15

Ref.: SS-JC-10001 3.2.1.26.10

Type: Boolean

Values: Logic 0 = No failure detected
Logic 1 = Failure detected

Comments: This bit is set for any failure isolated to the RT LRU. This field will be set to Logic 0 in the TACAN Standalone mode.

Field REMOTE POWER SUPPLY FAIL (RPS FAIL)

Word#42 Bit#14

Ref.: SS-JC-10001 3.2.1.26.10

Type: Boolean

Values: Logic 0 = No failure detected
Logic 1 = Failure detected

Comments: This is set for any failure isolated to the Remote Power Supply. This field will be set to Logic 0 in the TACAN Standalone mode.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field Decoded LRU/SRU Failure indicators (A12 to A1)

Word#42 Bits#0-11

Ref.: SS-JC-10001 3.2.1.26.10

Type: Boolean

Values: Logic 0 = No failure detected
Logic 1 = Failure detected

Comments: These bits identify the most probable failed SRU. It corresponds to the value set in the LRU/SRU 1 field when the LRU/SRU INDICATOR is set to SRU level. This field will be set to Logic 0 in the TACAN Standalone mode.

Field BUS FAIL

Word#43 Bit#15

Ref.: SS-JC-10001 3.2.1.26.10

Type: Boolean

Values: Logic 0 = No Failure
Logic 1 = Failure

Comments: This bit indicates a failure of the active bus as determined by a lack of expected activity. Activity is platform specific and set if no request for a BOM 01 has been received by the Terminal in a 12 second period.

Field VOICE 1 FAIL

Word#43 Bit#14

Field VOICE 2 FAIL

Word#43 Bit#13

Ref.: SS-JC-10002 3.2.5.2.6.2.1.g.4(c)

Type: Boolean

Values: Logic 0 = No Failure
Logic 1 = Failure

Comments: This bit indicates a failure of the voice encoding or decoding capability on the corresponding voice port. This field will be set to Logic 0 in the TACAN Standalone mode, or if the TACAN Waveform is running and the Link 16 Waveform is not running.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field VSWR A

Word#43 Bit#12

Field VSWR B

Word#43 Bit#11

Ref.: SS-JC-10001 3.2.1.26.10

Type: Boolean

Values: Logic 0 = No Failure
Logic 1 = Failure

Comments: This bit indicates excessive VSWR detected by either TACAN or TDMA operation on either or both antenna ports.

Field TDMA RECEIVE FAIL (TDMA RCV FAIL)

Word#43 Bits#10

Ref.: SS-JC-10002 3.2.5.2.6.2

Type: Boolean

Values: Logic 0 = No Failure
Logic 1 = Failure

Comments: This bit is set for any failure of the Terminal TDMA receive capability. This field will be set to Logic 0 in the TACAN Standalone mode, or if the TACAN Waveform is running and the Link 16 Waveform is not running.

Field TDMA RECEIVE DEGRADED PERFORMANCE (TDMA RCV DP) **Word#43 Bit#9**

Ref.: SS-JC-10002 3.2.5.2.6.2

Type: Boolean

Values: Logic 0 = No Degraded Performance
Logic 1 = Degraded Performance

Comments: This bit indicates a loss of performance of the TDMA receive capability. This field will be set to Logic 0 in the TACAN Standalone mode, or if the TACAN Waveform is running and the Link 16 Waveform is not running.

Field TDMA TRANSMIT FAIL (TDMA XMT FAIL)

Word#43 Bit#8

Ref.: SS-JC-10002 3.2.5.2.6.2

Type: Boolean

Values: Logic 0 = No Failure
Logic 1 = Failure

Comments: This bit is set for any failure of the Terminal TDMA transmit capability. This field will be set to Logic 0 in the TACAN Standalone mode, or if the TACAN Waveform is running and the Link 16 Waveform is not running.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field TDMA TRANSMIT DEGRADED PERFORMANCE (TDMA XMT DP) Word#43 Bit#7

Ref.: SS-JC-10002 3.2.5.2.6.2
Type: Boolean
Values: Logic 0 = No Degraded Performance
Logic 1 = Degraded Performance
Comments: This bit indicates a loss of performance of the TDMA transmit capability. This field will be set to Logic 0 in the TACAN Standalone mode, or if the TACAN Waveform is running and the Link 16 Waveform is not running.

Field TACAN FAIL (TAC FAIL) Word#43 Bit#6

Ref.: SS-JC-10003 3.2.5.1.1.2.b.3
Type: Boolean
Values: Logic 0 = No Failure
Logic 1 = Failure
Comments: Any failure resulting in an inability to use the TACAN function.

Field TACAN DEGRADED PERFORMANCE (TAC DP) Word#43 Bit#5

Ref.: SS-JC-10003 3.2.5.1.1.2.b.2
Type: Boolean
Values: Logic 0 = No Degraded Performance
Logic 1 = Degraded Performance
Comments: This bit indicates a TACAN degraded performance.

Field POWER SUPPLY FAIL (PS FAIL) Word#43 Bit#4

Ref.: SS-JC-10001 3.2.1.26.10
Type: Boolean
Values: Logic 0 = No Failure
Logic 1 = Failure
Comments: This bit indicates a failure of the RPS or the IPS SRU of the RT LRU. This field will be set to Logic 0 in the TACAN Standalone mode.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field TEST GO

Word#43 Bit#3

Ref.: SS-JC-10001 3.2.1.26.10

Type: Boolean

Values: Logic 1 = Start-up or Manually Initiated BIT completed and all tests passed.
Logic 0 = Start-up or Manually Initiated BIT completed and all tests NOT passed or SBIT or IBIT has not been performed (TACAN Standalone).

Comments: This bit is set at the completion of Start-up or Manually Initiated BIT if no failures have been detected. This field will be set to Logic 0 in the TACAN Standalone mode.

Field TERMINAL FAIL (TERM FAIL)

Word#43 Bit#2

Ref.: SS-JC-10001 3.2.1.26.4.q, SS-JC-10002 3.2.5.2.6.2, SS-JC-10003 3.2.5.1.1.2.b.3

Type: Boolean

Values: Logic 0 = No Failure
Logic 1 = Failure

Comments: This bit is a summary bit of any detected failure in the RT LRU or Remote Power Supply. This field will be limited to represent only those tests that are applicable in TACAN Standalone mode.

Field BIT STATUS

Word#43 Bit#0-1

Ref.: SS-JC-10001 3.2.1.26.10

Type: Coded

Values:

Value	Meaning
0	BIT completed
1	Not Used
2	Not Used
3	BIT in process

Comments: This field indicates the status of the start-up or manually initiated BIT. This field will be set to Logic 0 in the TACAN Standalone mode.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field DATE NEEDED (DN)

Word#44 Bits#13

Ref.: SS-JC-10002 3.2.1.1.1.4.6.4.e

Type: Coded

Values: 0 = Link 16 Waveform has a valid date
1 = Link 16 Waveform needs a valid date (APs 305 - 309 are all set to zero)

Comments: Indicates whether the Link 16 Waveform has a valid date. The Link 16 Waveform requires a date to determine what key to use. Without a date, keys cannot be associated with the waveform. This field is only valid when the initialization state is Load Complete - Valid Data, or Load Complete - Data Conflict. This bit field will be set to 0 during all other initialization states. This bit field will be set to 0 (date valid/date not needed) in Mode 4.

Field CHANNEL 1 OPEN

Word#44 Bits#12

Ref.: SS-JC-10001 3.2.1.11.2.6

Type: Boolean

Values: Logic 0 = Channel 1 Not Open (Power up)
Logic 1 = Channel 1 Open

Default: 0

Comments: When set to a Logic 1, the Terminal has determined that the Red Channel 1 and CSS Interface is open and the Operating Environment can be loaded on the channel. If this bit is set to a Logic 0, this indicates that the Red Channel 1 and the CSS Interface are not open which may be due to a missing MKEK. A Terminal failure may also result in the same indication. If the MKEK is loaded and the Terminal is functioning properly, this indication should be active between 1 and 2 minutes from turn-on.

Field BATTERY STATUS

Word#44 Bits#10-11

Ref.: SS-JC-10001 3.2.1.26.10.2

Type: Coded

Values:

Bit 11	Bit 10	Meaning
0	0	Batteries CSS and SYS Good
0	1	Battery CSS Good and Battery SYS Failed or Not Present
1	0	Battery CSS Failed or Not Present and Batteries SYS Good
1	1	Batteries CSS and SYS Failed or Not Present

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Comments: This field will be set to Logic 0 in the TACAN Standalone mode.

Field PA NORMAL FAIL (PA NORM) **Word#44 Bit#9**

Field PA MEDIUM FAIL (PA MED) **Word#44 Bit#8**

Field PA LOW FAIL **Word#44 Bit#7**

Ref.: SS-JC-10001 3.2.1.26.10

Type: Boolean

Values: Logic 0 = No Failure
Logic 1 = Failure

Comments: These three bits indicate a hard power failure was detected in the corresponding power mode by the Link 16 Waveform. These bits are not set if the TACAN power level fails.

Field HIA FAIL **Word#44 Bit#6**

Ref.: SS-JC-10001 3.2.1.26.10

Type: Boolean

Values: Logic 0 = No Failure
Logic 1 = HIA Failure

Comments: This bit indicates a failure of the HIA. This field will be set to Logic 0 in the TACAN Standalone mode, or if the TACAN Waveform is running and the Link 16 Waveform is not running.

Field HPA/PA BACKUP **Word#44 Bits#5**

Ref.: SS-JC-10001 3.2.1.26.10

Type: Boolean

Values: Logic 0 = No Failure
Logic 1 = Failure

Comments: This bit indicates that the HPA has reported a failure and the Terminal has reverted to transmission using the RFA SRU of the RT LRU. This field will be set to Logic 0 in the TACAN Standalone mode, or if the TACAN Waveform is running and the Link 16 Waveform is not running.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field HPA IPFF

Word#44 Bit#4

Ref.: SS-JC-10001 3.2.1.26.10

Type: Boolean

Values: Logic 0 = No Failure
Logic 1 = Failure

Comments: This bit indicates that the HPA has reported an IPF Failure. This field will be set to Logic 0 in the TACAN Standalone mode, or if the TACAN Waveform is running and the Link 16 Waveform is not running.

Field HPA FAIL

Word#44 Bit#3

Ref.: SS-JC-10001 3.2.1.26.10

Type: Boolean

Values: Logic 0 = No Failure
Logic 1 = Failure

Comments: This bit is set for a failure of the HPA. This field will be set to Logic 0 in the TACAN Standalone mode, or if the TACAN Waveform is running and the Link 16 Waveform is not running.

Field HPA DEGRADED PERFORMANCE (HPA DP)

Word#44 Bit#2

Ref.: SS-JC-10001 3.2.1.26.10

Type: Boolean

Values: Logic 0 = No Degraded Performance
Logic 1 = Degraded Performance

Comments: This bit is set when the HPA reports a degraded. This field will be set to Logic 0 in the TACAN Standalone mode, or if the TACAN Waveform is running and the Link 16 Waveform is not running.

Field EMC Data Log Status (EDLS)

Word#45 Bit#15

Ref.: SS-JC-10002 3.2.1.1.1.22.5.10.3

Type: Boolean

Values: Logic 1 = EMC Data Log has less than 20% storage remaining
Logic 0 = EMC Data Log has more than 20% storage remaining

Comments: The Link 16 Waveform will set this bit active (1) when the EMC Features data log (words 2056-5055) have less than 20% (300 available log entries) remaining. This bit is cleared after the waveform has provided the log to the host.

UNCLASSIFIED

Field SDU ALARM (SDUA)

Word#45 Bit#14

Ref.: SS-JC-10001 3.2.1.26.10

Type: Boolean

Values: Logic 0 = No Failure
Logic 1 = Failure

Comments: This bit is set whenever the cryptographic device declares an SDU alarm. This field will be set to Logic 0 in the TACAN Standalone mode.

Field 2X2 XCVR CH2 Degraded Performance (XCVR2 DP)

Word#45 Bit#13

Ref.: SS-JC-10001 3.2.1.26.10

Type: Boolean

Values: Logic 0 = No Degraded Performance
Logic 1 = Degraded Performance

Comments: This field will be set to Logic 0 in the TACAN Standalone mode.

Field 2X2 XCVR CH3 Degraded Performance (XCVR3 DP)

Word#45 Bit#12

Ref.: SS-JC-10001 3.2.1.26.10

Type: Boolean

Values: Logic 0 = No Degraded Performance
Logic 1 = Degraded Performance

Comments: This field will be set to Logic 0 in the TACAN Standalone mode.

Field 2X2 XCVR CH4 Degraded Performance (XCVR4 DP)

Word#45 Bit#11

Ref.: SS-JC-10001 3.2.1.26.10

Type: Boolean

Values: Logic 0 = No Degraded Performance
Logic 1 = Degraded Performance

Comments: This field will be set to Logic 0 in the TACAN Standalone mode.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -

Field RPS INUPT LINE VOLTAGE LEVEL (RPS LNSSENS)

Word#45 Bit#10

Ref.: SS-JC-10001 3.2.1.26.4.m & 3.2.1.27.1.1
Type: Boolean
Values: Logic 0 = RPS Indicates Normal Line Voltage
Logic 1 = RPS Indicates Abnormal Line Voltage
Comments: This bit indicates the status of the RPS Input Line Voltage Level discrete from the RPS LRU to the RT LRU (Per 4.2.4.10.2.4.3). This field will be set to Logic 0 in the TACAN Standalone mode.

Field RED IO DP

Word#45 Bit#9

Ref.: SS-JC-10001 3.2.1.26.10
Type: Boolean
Values: Logic 0 = No Degraded Performance
Logic 1 = Degraded Performance
Comments: This field will be set to Logic 0 in the TACAN Standalone mode.

Field Black Core Processor (BCP) Degraded Performance (BCP DP)

Word#45 Bit#8

Ref.: SS-JC-10001 3.2.1.26.10
Type: Boolean
Values: Logic 0 = No Degraded Performance
Logic 1 = Degraded Performance
Comments: This field will be set to Logic 0 in the TACAN Standalone mode.

Field CHASSIS DEGRADED PERFORMANCE (CHAS DP)

Word#45 Bit#7

Ref.: SS-JC-10001 3.2.1.26.10
Type: Boolean
Values: Logic 0 = No Degraded Performance
Logic 1 = Degraded Performance

Reference System:

FIGURE A-7 and A-8 illustrate the coordinate frames used by the Terminal navigation function. The MIDS uses the World Geodetic System (WGS)-84 parameters as its earth model. The i(inertial)-frame is considered to be located at the center of the ellipsoid and fixed with respect to the distant stars. The e(earth centered rotating)-frame is considered to be located at the center of the ellipsoid and rigidly attached to it. The l(local level)-frame is considered to have its origin at the true user position (the true user position can be considered to be at the center of mass of the physical platform the accelerometers are mounted on if the D/R is a gimballed inertial D/R) and would be tangent to the ellipsoid if its (geodetic) altitude was zero. The p(platform)-frame is considered to have its origin at the true user position but "tilted" from the l-frame. If the D/R is inertial, the misalignment angles θ_x , θ_y , θ_z (assumed small) describe this tilt.

If the D/R is non-inertial, then the p-frame is considered to coincide with the l-frame except for an azimuth misalignment θ_{Az} .

For no D/R, the p-frame is not considered. If the D/R is inertial, then the accelerations NAV receives from the Tailored Input/Output (TIO) are considered to have occurred along the p-frame axes. If the D/R is non-inertial, then the Terminal assumes the velocities it receives from the TIO occur along the p-frame. Using the misalignment angles, the Terminal is able to resolve the accelerations or velocities into the l-frame and improve on the error growth characteristic of the D/R. It should be noted that the above frames are an idealization - the i-frame is only an approximation to an inertial frame, the actual mounting of the accelerometers is not orthogonal nor rigid, so the p-frame is an approximation, and the quantities the Terminal calculates are not

Field TIME TAG

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1

Type: Unsigned Integer

Range/Units: 0 to 24h-LSB; LSB = 7.8125 ms

Comments: Defines the beginning of the time slot of message reception from midnight.

Field SYSTEM TYPE

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1

Type: Coded

Values:

Value	Meaning
0	Inertial

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
1	non-inertial
2	TOA-only
3	aided INS
4-7	Not used

Comments: Represents the NAV system type.

Field NAV STATE

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1

Type: Coded

Values:

Value	Meaning
0	Start up
1	Normal
2	Flywheel
3	Not used

Comments: Represents the state of the Terminal Nav system.

Field PLATFORM DEFINITION (PD)

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1

Type: Boolean

Values: Logic 0 = mobile
Logic 1 = fixed point

Comments: Indicates the platform type.

Field NAV VALIDITY

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1

Type: Coded

Values:

Value	Meaning
0	all quantities invalid
1	only geodetic quantities valid
2	geodetic and grid quantities valid

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
3	not used

Comments: Represents the navigation input status.
Geodetic quantities are valid when this field takes the Value 1 or 2.
Relative quantities are valid when this field takes the Value 2.

Field GEODETIC ALTITUDE QUALITY (Q_h)

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1

Type: Coded

Values:

Value	Altitude Uncertainty
0	> 18080 feet
1	<= 18080 feet
2	<= 9040 feet
3	<= 4520 feet
4	<= 2260 feet
5	<= 1600 feet
6	<= 1130 feet
7	<= 800 feet
8	<= 565 feet
9	<= 400 feet
10	<= 282 feet
11	<= 200 feet
12	<= 141 feet
13	<= 100 feet
14	<= 71 feet
15	<= 50 feet

Comments: This field reports the uncertainty in the geodetic altitude estimate. The value of the Geodetic altitude quality σ_h represented by Q_h is one standard deviation ($P(\sigma_h) = 68.27\%$).

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field GEODETIC AZIMUTH QUALITY (Q_{ag})

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1

Type: Coded

Values:

Value	Azimuth Uncertainty		Azimuth Uncertainty	
0	> 64	Milliradians	> 3.66	degrees
1	= 64	Milliradians	= 3.66	degrees
2	= 32	Milliradians	= 1.83	degrees
3	= 16	Milliradians	= 0.91	degrees
4	= 8	Milliradians	= 0.46	degrees
5	= 4	Milliradians	= 0.23	degrees
6	= 2	Milliradians	= 0.11	degrees
7	= 1	Milliradians	= 0.06	degrees

Comments: This field reports the uncertainty in the geodetic azimuth estimate. The value of the Geodetic azimuth quality σ_{ag} represented by Q_{ag} is one standard deviation ($P(\sigma_h) = 68.27\%$).

Field GEODETIC HORIZONTAL VELOCITY QUALITY (Q_{vg})

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1

Type: Coded

Values:

Value	Velocity Uncertainty	
0	> 10	feet/second
1	<= 10	feet/second
2	<= 7	feet/second
3	<= 5	feet/second
4	<= 3.5	feet/second
..
15	<= 0.08	feet/second

Comments: Indicates the horizontal velocity quality in feet/second. Reported value is the greatest number for which $\sigma_{vg} = 10 \cdot 2^{((1-Q_{vg})/2)}$ feet/second is greater than the geodetic horizontal velocity uncertainty, where σ_{vg} represents a circular standard error ($P(\sigma_{vg})=39.35\%$).

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field GEODETIC HORIZONTAL POSITION QUALITY (Qpg)

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1

Type: Coded

Values:

Value	Position Uncertainty
0	> 18080 feet
1	<= 18080 feet
2	<= 9040 feet
3	<= 4520 feet
4	<= 2260 feet
5	<= 1600 feet
6	<= 1130 feet
7	<= 800 feet
8	<= 565 feet
9	<= 400 feet
10	<= 282 feet
11	<= 200 feet
12	<= 141 feet
13	<= 100 feet
14	<= 71 feet
15	<= 50 feet

Comments: This field reports the uncertainty in the geodetic horizontal Position estimate. The value of the Geodetic horizontal Position quality σ_{pg} represented by Q_{pg} is a circular standard deviation ($P(\sigma_{pg}) = 39.35\%$).

Field GEODETIC LATITUDE

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1

Type: BAM

Range/Units: LSB = $180 * 2^{-31}$ degrees; MSB = -180 degrees

Comments: The two words report the geodetic latitude.
Valid only when the NAV VALIDITY field is set to "Valid data."

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field GEODETIC LONGITUDE

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1
Type: BAM
Range/Units: LSB = $180 * 2^{-31}$ degrees;
MSB = -180 degrees
Comments: The two words report the geodetic longitude.
Valid only when the NAV VALIDITY field is set to "Valid data."

Field GEO X VELOCITY

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1
Type: 32-bit Real Institute of Electrical and Electronic Engineers (IEEE) Standard
Range/Units: feet/second;
Comments: Valid only when the NAV VALIDITY field is set to "Valid data."
The X direction is normally NORTH when Wander Angle is 0 degrees.

Field GEO Y VELOCITY

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1
Type: 32-bit Real IEEE Standard
Range/Units: feet/second;
Comments: Valid only when the NAV VALIDITY field is set to "Valid data."
The Y direction is normally West when Wander Angle is 0 degrees.

Field GEODETIC ALTITUDE

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1
Type: 32-bit Real IEEE Standard
Range/Units: feet
Comments: Valid only when the NAV VALIDITY field is set to "Valid data."
It indicates the Geodetic Altitude referenced to Mean Sea Level, positive upward.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field GEODETIC AZIMUTH CORRECTION

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1

Type: BAM

Range/Units: LSB = $180 * 2^{-31}$ degrees; MSB = -180 degrees;

Comments: θ_z . It is the angle of rotation about the z-axis, nominally up, that aligns the Host coordinate system to the best estimate of the Link 16 coordinate system, where a positive angle implies a clockwise rotation about the z-axis.

Valid only when the Nav System Type is set to Inertial or Non-Inertial and when the NAV VALIDITY field is set to "Valid data."

Field TIME QUALITY

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1

Type: coded

Values:

Value	Meaning
0	> 18080 Nanosecond
1	<= 18080 Nanosecond
2	<= 9040 Nanosecond
3	<= 4520 Nanosecond
4	<= 2260 Nanosecond
5	<= 1600 Nanosecond
6	<= 1130 Nanosecond
7	<= 800 Nanosecond
8	<= 565 Nanosecond
9	<= 400 Nanosecond
10	<= 282 Nanosecond
11	<= 200 Nanosecond
12	<= 141 Nanosecond
13	<= 100 Nanosecond
14	<= 71 Nanosecond
15	<= 50 Nanosecond

Comments: For an NTR without External Time Reference Time Quality is 15.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field KALMAN FILTER ALTERATION (KFA)

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1
Type: Boolean
Values: Logic 1 = The Kalman filter is altered
Comments: This bit would be set whenever there is a change that requires that the Kalman Filter be reconfigured by activating or de-activating particular state elements, for example, when the Terminal is switched to Primary Nav Controller, certain grid states would be turned off and others turned on.

Field KALMAN FILTER RESET (KFR)

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1
Type: Boolean
Values: Logic 1 = The Kalman filter is reset
Comments: This bit would be set whenever there is either an internal Kalman Filter reset due to excessive observation validity failures or an external reset due to change in the NAV system in use or the Terminal receiving a NAV RESET via initialization data.

Field X DAMPING STATE OR NORTH SPEED OF MEDIUM

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1
Type: 32-bit Real IEEE Standard
Range/Units: Feet/second;
Comments: It indicates either: Estimated X velocity Damping error when SYSTEM TYPE is Inertial or Estimated airmass or water motion speed in north direction when SYSTEM TYPE is Non-Inertial.

Field Y DAMPING STATE OR WEST SPEED OF MEDIUM

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1
Type: 32-bit Real IEEE Standard
Range/Units: Feet/second;
Comments: It indicates either: Estimated Y velocity Damping error when SYSTEM TYPE is Inertial or Estimated airmass or water motion speed in north direction when SYSTEM TYPE is Non-Inertial.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field X-MISALIGNMENT CORRECTION

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1
Type: BAM
Range/Units: Degrees;
Comments: θ_x . Platform misalignment about the X axis with respect to the Terminal's estimated local level frame. The sense of the rotation is positive counter-clockwise from the platform frame when SYSTEM TYPE is Inertial.

Field Y-MISALIGNMENT CORRECTION

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1
Type: BAM
Range/Units: Degrees;
Comments: θ_y . Platform misalignment about the Y axis with respect to the Terminal's estimated local level frame. The sense of the rotation is positive counter-clockwise from the platform frame when SYSTEM TYPE is Inertial.

Field WANDER ANGLE

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1
Type: BAM
Range/Units: Degrees;
Comments: α . The angular difference between the north axis estimate and reference X axis estimate. The sense is positive counterclockwise from north axis to X axis.

Field COMMON GRID ORIGIN LATITUDE

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1
Type: BAM
Range/Units: Degrees;
Comments: Reserved for future use.

Field COMMON GRID ORIGIN LONGITUDE

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1

Type:

Range/Units:

Comments: Reserved for future use.

A.5.3.4 Reserved

A.5.3.5 MIDS time of day and chronometer (words #121-150)

A.5.3.5.1 MIDS time of day words (words #121-122)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
121	0				HOURS				0				MINUTES			
122	0				SECONDS				0				SLOTS			

Comments: MIDS Time Of Day contains MIDS Network Time after coarse sync is confirmed. The MIDS Network time is not affected by changes to Time of Day (AP286, AP287, AP288).

Field HOURS

Ref.: SS-JC-10002 3.2.1.1.1.5.2

Type: Unsigned Integer

Range/Units: 0 to 23 hours, LSB is 1 hour
(24 to 31 not used)

Comments: Specifies the hour of day in MIDS time of day format.

Field MINUTES

Ref.: SS-JC-10002 3.2.1.1.1.5.2

Type: Unsigned Integer

Range/Units: 0 to 59 minutes, LSB is 1 minute
(60 to 64 not used)

Comments: Specifies the minutes of day in MIDS time of day format.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field SECONDS

Ref.: SS-JC-10002 3.2.1.1.1.5.2
Type: Unsigned Integer
Range/Units: 0 to 59 seconds, LSB is 1 second
(60 to 64 not used)
Comments: Specifies the seconds of day in MIDS time of day format.

Field SLOTS

Ref.: SS-JC-10002 3.2.1.1.1.5.2
Type: Unsigned Integer
Range/Units: 0 to 127 slots, LSB is 1 slot
Comments: Specifies the slots of day in MIDS time of day format.

A.5.3.5.2 Terminal chronometer time words (words #123-124)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
123	OI	0	OS	SECONDS						SLOTS						
124	DAYS					HOURS					MINUTES					

Comments: The chronometer is updated by the Time Of Day AP286, AP287 and AP288. The Terminal will update the Chronometer Time Words with the MIDS Network Time after coarse sync. is confirmed.
The Terminal uses the chronometer time after a START NET ENTRY (AP353 value 1) or NET ENTRY RESET (AP321 value 1) to estimate the network time for Initial Entry processing.

Field OVERFLOW INDICATOR (OI)

Ref.: SS-JC-10002 3.2.1.1.1.5.2
Type: Boolean
Values: Logic 1 = Chronometer Time overflow
Logic 0 = Normal operation
Comments: This indicator is set after the DAYS field exceeds 31 (rolling over to 0) that means after the 32nd day in which the Terminal has not been in the Link 16 network. It is reset when a new time is written to the chronometer.

Comments: Chronometer minutes.

A.5.3.6 Transmission queues status (words #151-180)

The data contained in this 22-word status segment is output periodically to the Host by means of the Transmission Queue Status FOM (FOM12).

A.5.3.6.1 Transmission queues status by PG blocks #1-10 (words #151-170)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
I	0								PG INDEX NUMBER							
II	0								NUMBER OF BUFFERS AVAILABLE							

Field PG INDEX NUMBER

Ref.: SS-JC-10002 3.2.1.1.1.20.3.3.a
Type: Unsigned Integer
Range: 0 to 511
(0 = No Statement)
Comments: The PG index number for which the Host-to-Terminal message flow is individually controlled. The 10 PG index numbers are specified in the Transmit PG Related Data in the Initialization Data File (AP139).

Field NUMBER OF BUFFERS AVAILABLE

Ref.: SS-JC-10002 3.2.1.1.1.20.3.3.a
Type: Unsigned Integer
Range: 0 to 280
Comments: The difference between the maximum number of message transfers the Terminal is enabled to store for the PG defined in the first word, (see AP143 STORAGE LIMIT for the Transmit PG Related Data of the Initialization Data File) and the number currently stored.

UNCLASSIFIED
FOR OFFICIAL USE ONLY

Appendix A

Field REALLOCATION TABLE ENTRIES

Ref.: SS-JC-10002 3.2.1.1.1.11.2.2.b

Type: Unsigned Integer

Range: 0 to 127

Comments: The number of Pool participants, excluding itself, for which the Terminal has valid entries in its reallocation table.

Valid if the POOL STATE field is not "Suspended" or "Inactive."

Field POOL STATE

Ref.: SS-JC-10002 3.2.1.1.1.11.2.2

Type: Coded

Values:

Value	Meaning
0	Suspended
1	Inactive: Bad Initialization Data
2	Active: Attempting pool entry No allocation of slots
3	Active: Missed announcement The Terminal is allocating slots to itself but was unable to transmit its own TSR announcement message in the last period. Not used in centralized mode.
4	Fully Active
5-7	Not Used

Comments: Detailed operate/suspend state of the reallocation pool.

Pools that are "Inactive" are those for which bad initialization data have been specified. The Terminal performs the following validity checks on each reallocation pool:

1. all access 17 and 18 time slot assignment blocks on the pool have the same Participation Group.
2. the PG is not equal to 1, 2, 3, 12 or 13.
3. the number of access 17 TSAs is 1, 2, or 3.
4. there is exactly 1 access 18 TSA if the pool is not in centralized mode or there are no access 16 (dedicated) transmit slots for the TSR PG, or at most 1 access 18 TSA if the pool is in centralized mode.
5. the reallocation period is 6, 12, 18, 24, 30, 36, or 48 seconds.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

6. the access 17 TSAs can be decomposed into 2 to 512 basic blocks.

If any of the above checks fail, the Terminal sets the POOL STATE field to "Inactive: Bad Initialization Data."

If TSR data is provided, for a pool in the "Inactive: Bad Initialization Data" state, that passes validity checking, the Terminal will set the POOL STATE to "Suspended" for that pool. "Suspended" will, therefore, always imply that valid data exists for that pool.

Field CURRENT REALLOCATION PERIOD

Ref.: SS-JC-10002 3.2.1.1.1.11.1.3.2

Type: Unsigned Integer

Range: 0 to 7

Comments: The number of the current Reallocation Period, modulo 8, begins with period 0 which starts just after midnight (if the reallocation period offset is non-zero) or at midnight (if the reallocation period offset is zero).

Valid if net time is valid and the POOL STATE field is not "Suspended" or "Inactive."

Field PERCENTAGE OF POOL USED

Ref.: SS-JC-10002 3.2.1.1.1.11.2.2.d

Type: Unsigned Integer

Range/Units: 0 to 127 (LSB is 100%/127; Scale 0 to 100%)

Comments: Percentages greater than 100% (indicating transmit conflicts) are reported as 100%.

Valid only if the POOL STATE field is not "Inactive" or "Suspended."

This value, in units of basic blocks divided by the pool size, represents the sum of all the valid requests known to the Terminal.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field PERCENTAGE OF REQUEST SATISFIED

Ref.: SS-JC-10002 3.2.1.1.1.11.2.2.c
Type: Unsigned Integer
Range/Units: 0 to 127 (LSB is 100%/127; Scale 0 to 100%)
Comments: Percentages greater than 100% are reported as 100%.
Valid if the POOL STATE field is not "Suspended" or "Inactive."

Note 1:

This variable is computed as:

$$((\#BBs * q) - 1 + D) / ((H * W) / L)$$

Where:

- #BBs = the number of basic blocks chosen for own Terminal at previous freeze point.
- q = # Slots per basic block
- D = number of time slots per Reallocation Period provided by access 16 (dedicated) TSA(s) in the TSR PG.
- H = latest "number of messages"
- W = latest "average number of words per message." Done in its raw value (uncoded form).
- L = # codewords (3, 6, or 12) allowed by the packing limit of the TSR PG.

Note 2:

If the Host request is 0 and the Terminal has been allocated slots, the Terminal will report this variable as 100%.

Note 3:

If the Terminal has been allocated no slots, the Terminal will report this variable as 0%, unless there is an access 16 TSA (D > 0).

Field PARTICIPATION GROUP

Ref.: SS-JC-10002 3.2.1.1.1.11.2.3
Type: Unsigned Integer
Range: 0 to 511
Comments: The Participation Group on which the reallocation pool is operated.
Set to 0 if the POOL STATE field is "Inactive" or "Suspended."

Word	0															FPC
655																

Field FREEZE POINT CONFLICT (FPC)

Ref.: SS-JC-10002 3.2.1.1.1.11.1.3.3

Type: Coded

Values:

Value	Meaning
0	No freeze point conflict
1	Freeze point of active TSR pool conflict. Degradation is possible.

Comments: This field informs the operator when the freeze points of the active TSR pools conflict. The reallocation period or offset of a poll may have to be modified to prevent degradation.

The FREEZE POINT CONFLICT field will be set for complete overlap or partial overlap of the calculation period of the two pools. For multiple pool operation, Freeze Point overlaps should be avoided, since following the Freeze Point, the Terminal selects Time Slots to assign to itself for the next reallocation period. If there is overlap, there may be degradation, that is, the process may not be completed in time to use all the slots in the next reallocation period for all active pools.

A.5.3.13 TSR pool #n status block word 4 (words #661-668) (where n is 1 to 8)

Type: Coded

Values:

A-520

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
0	Pool is suspended
1	Not used
2-512	Specified number of basic blocks
513-1023	Not used

Comments:

Field BASIC BLOCK RECURRENCE RATE #N

Ref.: SS-JC-10002 3.2.1.1.1.11.1.2

Type: Coded

Values:

Value	Meaning
0	Pool is suspended
1-3	Not used
4-15	Specified recurrence rate

Comments:

A.5.3.14 TSR pool x basic blocks selected (own terminal) words 1-32 (words #691-722 and words # 811-842)

This paragraph describes the words named in the Status Data file description as TSR Pool 1 and TSR Pool 2 Basic Blocks Selected (own Terminal), corresponding to words 691 to 722 and 811 to 842 respectively. In the diagram below, word I corresponds to word 691 for TSR pool 1 and word 811 for TSR pool 2. Successive words in the diagram corresponds to successive words in the Status Data file description, in incremental order, and with the correspondence to pools 1 and 2, as explained above.

Field BASIC BLOCK #N SELECTED (BBS) (where N is 0 to 511)

Ref.: SS-JC-10002 3.2.1.1.1.11.5.5

Type: Boolean

Values: Logic 1 = Basic Block was selected for own Terminal transmit
Logic 0 = Basic Block was not selected for own Terminal transmit

Comments: These words are updated at the end of slot selection processing. They are valid if the corresponding POOL STATE (word #631, #634, ..., #658), for the TSR X POOL NUMBER defined in words #729 for pool 1 and #849 for pool 2, is 3 ("Active Missed Announcement") or 4 ("Fully Active").

A.5.3.15 Complementary TSR x pool status (own terminal) words (words #723-729 and words #843-849)

This paragraph describes the words 723 to 729 and 843 to 849. In the diagram below, word I corresponds to word 723 for Complementary TSR Pool 1 Status and word 843 for Complementary TSR Pool 2 Status. Successive words in the diagram corresponds to successive words in the Status Data file description, in incremental order, and with the correspondence to pools 1 and 2, as explained above.

Word		
I	TSR POOL X MAXIMUM TSR EXECUTIVE EXECUTION TIME	
II	TSR POOL X NUMBER OF TSR EXECUTIVE EXECUTION TIMES EXCEEDING 4 SLOTS	
III	TSR POOL X SADO	0
IV	TSR POOL X I PARAMETER	
V	TSR POOL X K PARAMETER	
VI	TSR POOL X N PARAMETER	
VII	0	TSR POOL X NUMBER

In the descriptions below, X can have the values 1 or 2.

Field TSR POOL X MAXIMUM TSR EXECUTIVE EXECUTION TIME

Ref.: SS-JC-10002 3.2.1.1.1.11.5.5

Type: Coded

Values:

Value	Meaning
0	Maximum is 4 or less (4 is the nominal value)
1-4	Not used
5-32767	Maximum number of slots

Comments: Maximum number of time slots that the TSR executive module has taken to run.

Field TSR POOL X NUMBER OF TSR EXECUTIVE EXECUTION TIMES EXCEEDING 4 SLOTS

Ref.: SS-JC-10002 3.2.1.1.1.11.5.5

Type: Unsigned Integer

Range: 0 to 65535

Comments: Number of times that the TSR executive took more than 4 slots to run.

UNCLASSIFIED

Field TSR POOL X SLOT ALLOCATION DEGRADED OPERATION (SADO)

Ref.: SS-JC-10002 3.2.1.1.1.11.5.5
Type: Boolean
Values: Logic 1 = Slot allocation degraded operation
Logic 0 = Slot allocation normal operation
Comments: When this field is set to logic 1, the slot allocation processing for the current period did not finish prior to the start of the period. TSR transmit slots for the Terminal may have been lost. This bit is latched until the pool is suspended.

Field TSR POOL X I PARAMETER

Ref.: SS-JC-10002 3.2.1.1.1.11.5.5 and Table XIV
Type: Unsigned Integer
Range: 0 to 511
Comments: TSR I parameter for own Terminal as used in indexed coordinated contention algorithm for the current reallocation period. Its range is limited to a value that is one less than the number of Basic Blocks in the TSR Pool (see Status words 661-668).

Field TSR POOL X K PARAMETER

Ref.: SS-JC-10002 3.2.1.1.1.11.5.5 and Table XV
Type: Unsigned Integer
Range: 0 to 511
Comments: TSR K parameter for own Terminal as used in indexed coordinated contention algorithm for the current reallocation period. Its range is limited to a value that is one less than the number of Basic Blocks in the TSR Pool (see Status words 661-668).

Field TSR POOL X N PARAMETER

Ref.: SS-JC-10002 3.2.1.1.1.11.5.5
Type: Unsigned Integer
Range: 0 to 3
Comments: TSR N parameter for own Terminal as used in indexed coordinated contention algorithm for the current reallocation period

Field CURRENT SET INDEX NUMBER

Ref.: SS-JC-10002 3.2.1.1.1.19.2
Type: Unsigned Integer
Range: 0 to 255
Comments: Indicates the initialization data set used for the current initialization data.

Field SET INDEX NUMBER #x (x in 1 to 8)

Ref.: SS-JC-10002 3.2.1.1.1.19.2
Type: Unsigned Integer
Range: 0 to 255 (0 is No Statement)
Comments: Indicates the Set Index Number of the initialization data sets currently stored in the Terminal. Set to 0 when no set is loaded.

Field LOAD STATUS #x (x in 1 to 8)

Ref.: SS-JC-10002 3.2.1.1.1.20.1.1
Type: Coded
Values:

Value	Meaning
0	No Statement - corresponding set not loaded
1	Set rejected
2	Not Used
3	Validity Check in progress
4	Validity Check complete - Data Conflict
5	Validity Check Complete - Valid Data
6-7	Not Used.

Comments: Indicates the current status of the corresponding initialization data set.

A.5.3.17.2 Current use set number (word #961) and initialization data load status words 1-37 (words #962-998), words 39-58 (words #1000-1019)

All the bits defined in these words are cleared during Terminal start-up (see A.4.2.1) and set appropriately upon completion of validity checking (see A.4.2.3).

The Validity Checking of the Adaptable Parameters Table, TABLE A-CLI, provides the list of APs that are validity checked together with the rejection requirement.

UNCLASSIFIED

"Illegal Value per System/Segment ICS" means a value marked either "illegal" or "not used" in the ICS.

The list of Adaptable Parameters Automatically changed by the Terminal, TABLE A-CLII provides the list of APs that are automatically changed by the Terminal due to data change or simultaneous setting that result in illegal values of the APs listed in the table.

TABLE A-CLI. Validity checking of the adaptable parameters

Adaptable Parameter	Rejection Requirement	Number of Bits Required for Status
Test Mode (AP002)	Illegal Value per System/Segment ICS	1 bit
Transmit Mode (AP003)	Illegal Value per System/Segment ICS	1 bit
Terminal State (AP004)	Illegal Value per System/Segment ICS	1 bit
Communication Mode (AP008)	Illegal Value per System/Segment ICS	1 bit
Primary Source Track Number (AP009)	per STANAG 5516	1 bit
Output Power Mode (AP011)	per 3.2.1.1.1.2.10.1 and 3.2.1.1.1.22.5.1.6 of SS-JC-10002	1 bit
Network Time Reference (AP015)	per 3.2.1.1.1.17.7.2 of SS-JC-10002	1 bit
NAV (AP017)	Illegal Value per System/Segment ICS	1 bit
Platform Type (AP028)	Illegal Value per System/Segment ICS	1 bit
Default Net Number (AP037)	With Respect to the Net Number Limit Variable Parameter (VP007)	1 bit
Voice Channelization (AP042)	Illegal Value per System/Segment ICS	1 bit
Secondary Source Track Number (AP051)	per STANAG 5516	16 bits
Repromulgation State (AP054)	per 3.2.1.1.1.22.5.9.2 of SS-JC-10002	1 bit
Time Slot Assignments	per 3.2.1.1.1.8.3.4 of SS-JC-10002	384 bits
Operate/Suspend Parameter (AP108)	Illegal Value per System/Segment ICS	8 bits
Reallocation Period (AP112)	Illegal Value per System/Segment ICS	8 bits
Participation Group (AP121)	Illegal Value if 0,2,3,12,13 or if another active pool already contains the TSR TSAs with this PG or if TSR TSAs with this PG can not be found in the TSA Table.	8 bits
Voice Group A Starting Net (AP123)	Illegal Value per System/Segment ICS and with respect to Net Usage Control (AP467)	1 bit
Voice Group B Starting Net (AP125)	Illegal Value per System/Segment ICS and with respect to Net Usage Control (AP467)	1 bit
Control Group Starting Net (AP127)	Illegal Value per System/Segment ICS and with respect to Net Usage Control (AP467)	1 bit
Power Select (AP137)	per 3.2.1.1.1.3.7.4 of SS-JC-10002	32 bits

TABLE A-CLII. List of adaptable parameters automatically changed by the terminal

Adaptable Parameter	Value	Reset condition	Internal setting
AP004 Terminal State	“Link 16 and TACAN Terminal Operational” or “Link 16 Terminal Operational” or “TACAN Terminal Operational”	AP437 TACAN CONTROL SELECT = 0 ("TACAN flight control data is provided via the TACAN serial control bus") & (PLATFORM TYPE = "N") & (CURRENT_INITIALIZATION_STATE = “Load Complete, Valid Data” or “Load Complete, Data Conflict”)	“Link 16 and TACAN Terminal Operational” or “Link 16 Terminal Operational” or “TACAN Terminal Operational”
AP017 NAV (Organization user type)	"Primary User"	AP003 TRANSMIT MODE = "Conditional Radio Silence," "Polling," or "TDMA Silent" or AP383 LTTI = “Transmission Inhibit” or LTTI Discrete	"Secondary User" (See note)
	"Secondary User"	AP015 NETWORK TIME REFERENCE = "Network Time Reference"	"Primary User"
AP015 NETWORK TIME REFERENCE	"Network Time Reference"	AP003 TRANSMIT MODE = "Conditional Radio Silence," "Polling," or "TDMA Silent"; AP383 LTTI = "Transmission Inhibit" or LTTI Discrete; AP004 TERMINAL STATE = "TACAN Operational" loss of prime power for more than 10 seconds; or power-on interface set to off for more than 10 seconds.	"Not a Network Time Reference"
AP021 SEQUENCE NUMBER	1 to 7	When the date is provided by the Host in the init words 1880-1881 (AP305, AP306 & AP307 DATE, DAY of YEAR, AP308 & AP309 DATE, YEAR) and sequence number different from zero.	Depends on the date entered by the Host
		Link 16 network time enters the next day(midnight)	Increment value(or change 7 to 1)
AP076 and AP091 CRYPTO MODE	“Common Variable Mode” or “Partitioned Variable Mode”	PG INDEX NUMBER (A087 or AP104) is the same as PG A or PG B (see A.4.4.50) and Value ≠ CRYPTO MODE of the PG’s first slot assignment.	Same value as that of the PG’s first slot assignment
AP078, AP084, AP086, AP093, AP101, AP103 and AP151 NET NUMBER	0 to 126	PG INDEX NUMBER (A087 or AP104) is the same as PG for net selection (AP152) and Value ≠ NET NUMBER (AP078 or AP093) of the PG’s first slot assignment.	Same value as that of the PG’s first slot assignment
AP088 and AP105 TRANSEC CVLL	1 to 127	PG INDEX NUMBER (A087 or AP104) is the same as PG A or PG B (see A.4.4.50) and Value ≠ TRANSEC CVLL of the PG’s first slot assignment.	Same value as that of the PG’s first slot assignment

Appendix A

TABLE A-CLII. List of adaptable parameters automatically changed by the terminal - Continued

Adaptable Parameter	Value	Reset condition	Internal setting
AP089 and AP106 MSEC CVLL	1 to 127	PG INDEX NUMBER (A087 or AP104) is the same as PG A or PG B (see A.4.4.50), CRYPTO MODE (AP076 or AP091) = 1, and Value \neq MSEC CVLL of the PG's first slot assignment.	Same value as that of the PG's first slot assignment
AP305 to AP309 Date	Valid date originally entered by the user	Crossing Midnight	Incremented by one day.
AP353 START NET ENTRY	"Do Not Start Entry"	AP321 = "Reinitiate Network Entry"	Automatically Start Net Entry
Protected pair: PG _i -CVLL _i (AP457-AP458)	Unoccupied table position (PG _i = 0 and CVLL _i = 0 in table)	Host input in accordance SS-JC-10002 3.2.1.1.1.8.3.3.12	Non-zero values, in accordance with a new non-relay time slot assignment block (A.4.4.28.1) or a new cryptovvariable logical label definition word (A.4.4.33).

Note: On termination of the reset condition the AP is reset to "Primary User."

Explanatory notes: The table assumes that the second column is the setting of the adaptable parameter that was chosen by the Host. The third column presents the condition (either as a result of a switch due to a data change or a simultaneous setting) that results in the illegal state. The fourth column contains the resultant change in the adaptable parameter setting by the Terminal.

Appendix A

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

If default settings result in an illegal condition, the Terminal automatically overrides the illegal setting.

After any of these automatic changes has occurred, the original setting will not be restored when the condition is over.

FIGURE A-12. Status words 1011-1019

Field CURRENT USE SET NUMBER

Ref.: SS-JC-10002 3.2.1.1.1.19.2

Type: Unsigned Integer

Range: 0 to 255

Comments: Indicates the number of the Current Use Set to which the following status words apply.

Field TEST MODE (TM)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f

Type: Boolean

Values: Logic 1 = Validity check fail in AP002 TEST MODE.
Logic 0 = Validity check OK.

Comments: Indicates the validity check status of the AP002 TEST MODE of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field TRANSMIT MODE (TXM)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP003 TRANSMIT MODE.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP003 TRANSMIT MODE of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field TERMINAL STATE (TS)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP004 TERMINAL STATE.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP004 TERMINAL STATE of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field COMMUNICATION MODE (CM)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP008 COMMUNICATION MODE.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP008 COMMUNICATION MODE of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field PRIMARY SOURCE TRACK NUMBER (PRI STN)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP009 PRIMARY SOURCE TRACK NUMBER.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP009 PRIMARY SOURCE TRACK NUMBER of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field OUTPUT POWER MODE (OPM)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP011 OUTPUT POWER MODE.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP011 OUTPUT POWER MODE of the Current Initialization Data File received in the last initialization data load in accordance with SS-JC-10002 3.2.1.1.1.2.10.1 and 3.2.1.1.1.22.5.8 (see A.4.2.2).

Field PG-CVLL OVERFLOW (PCO)

Ref.: SS-JC-10002 3.2.1.1.1.8.3.4.q
Type: Boolean
Values: Logic 1 = Validity check fail. Overflow detected. Attempt to load a slot assignment block or a PG 9, 12 or 13 CVLL that would result in the creation of a 31st PG-CVLL pair in the table of protected PGs (A.4.4.52).
Logic 0 = Validity check OK (no overflow detected).
Comments: Whenever this field is set to logic 1, there will also be a TSA #x indication in words 965 to 968 and words 1000 to 1019 or a validity indicator (N and N+1) (VI #x) indication in words 972 to 983 to identify the data change that will have caused the overflow condition. Once set, this field cannot be cleared until a Restart-use defaults command is received or if a stored set is activated.

Field NAV

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP017 NAV.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP017 NAV of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field PLATFORM TYPE (PT)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP028 PLATFORM TYPE.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP028 PLATFORM TYPE of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field DEFAULT NET NUMBER (DNN)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP037 DEFAULT NET NUMBER.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP037 DEFAULT NET NUMBER of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field VOICE CHANNELIZATION (VC)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP042 VOICE CHANNELIZATION.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP042 VOICE CHANNELIZATION of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field FREQUENCY REMAPPING ENABLE (REM ENA)

Ref.: SS-JC-10002 3.2.1.1.1.2.10.1
Type: Boolean
Values: Logic 1 = Validity check fail in AP700 Frequency Remapping Enable Adaptable Parameter.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP700 FREQUENCY REMAPPING ENABLE of the Current Initialization Data File received in the last initialization data load in accordance with SS-JC-10002 3.2.1.1.1.2.10.1 (see A.4.2.2). Change

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

in the authorized frequencies is not allowed when the terminal is performing
initial network entry, is in coarse synchronization or is in fine synchronization.

Field FREQUENCY REMAPPING LIST (RFL)

Ref.: SS-JC-10002 3.2.1.1.1.2.10.1
Type: Boolean
Values: Logic 1 = Validity check fail in AP701 Remapped Frequency Number List
Adaptable Parameter.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP701 REMAPPED FREQUENCY
NUMBER LIST of the Current Initialization Data File received in the last
initialization data load in accordance with SS-JC-10002 3.2.1.1.1.2.10.1 (see
A.4.2.2).

Field SECONDARY SOURCE TRACK NUMBER (SEC STN #x)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP051 SECONDARY SOURCE TRACK
NUMBER.
Logic 0 = Validity check OK.
Comments: Each bit indicates the validity check status of the corresponding AP051
SECONDARY SOURCE TRACK NUMBER of the Current Initialization Data
File received in the last initialization data load (see A.4.2.2).
Secondary Source Track Number is checked as per STANAG 5516.

Field REPROMULGATION STATE (RS)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP054 REPROMULGATION STATE.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP054 REPROMULGATION STATE
of the Current Initialization Data File received in the last initialization data load
(see A.4.2.2).

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field TIME SLOT ASSIGNMENT #x (TSA #x) (Blocks 1-64)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in TSA Block.
Logic 0 = Validity check OK.
Comments: Each bit indicates the validity check status of the Time Slot Assignment Block #x of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field OPERATE/SUSPEND PARAMETER #x (O/S P #x)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP108 OPERATE/SUSPEND PARAMETER.
Logic 0 = Validity check OK.
Comments: Each bit indicates the validity check status of the AP108 OPERATE/SUSPEND PARAMETER #x of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field REALLOCATION PERIOD #x (RP #x)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP112 REALLOCATION PERIOD.
Logic 0 = Validity check OK.
Comments: Each bit indicates the validity check status of the AP112 REALLOCATION PERIOD #x of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field PARTICIPATION GROUP #x (PG #x)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP121 PARTICIPATION GROUP.
Logic 0 = Validity check OK.
Comments: Each bit indicates the validity check status of the AP121 PARTICIPATION GROUP #x of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field VOICE GROUP A STARTING NET (VG A SN)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP123 VOICE GROUP A STARTING NET.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP123 VOICE GROUP A STARTING NET of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field VOICE GROUP B STARTING NET (VG B SN)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP125 VOICE GROUP B STARTING NET.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP125 VOICE GROUP B STARTING NET of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field CONTROL GROUP STARTING NET (CGSN)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP127 CONTROL GROUP STARTING NET.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP127 CONTROL GROUP STARTING NET of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field POWER SELECT #x (PS #x)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP137 POWER SELECT
Logic 0 = Validity check OK.
Comments: Each bit indicates the validity check status of the AP137 POWER SELECT field in the corresponding Transmit PG Related Data Block #x of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field PACKING LIMIT #x (PL #x)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP138 PACKING LIMIT.
Logic 0 = Validity check OK.
Comments: Each bit indicates the validity check status of the AP138 PACKING LIMIT #x of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field STORAGE LIMIT #x (SL #x)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP143 STORAGE LIMIT
Logic 0 = Validity check OK.
Comments: Each bit indicates the validity check status of the AP143 STORAGE LIMIT field in the corresponding Transmit PG Related Data Block #x of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).
Note: The Terminal validates the storage limits in the order they are received upon a load. For the individually controlled PGs, the Terminal processes the ten first entered (order in which they are received upon a load) and will set the corresponding bit if the storage limit is exceeded. For the commonly controlled PGs, the Terminal sums up the storage limit and sets the bit for the PG that causes the limit to be exceeded.

Field NET NUMBER #x (NN #x)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP151 NET NUMBER.
Logic 0 = Validity check OK.
Comments: Each bit indicates the validity check status of the corresponding AP151 NET NUMBER of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field VARIABLE DEFINITION NET SELECTION PG A INDEX NUMBER (PGA IN)

Ref.: SS-JC-10002 3.2.1.1.1.8.6.2.e.1
Type: Unsigned integer
Values: Logic 1 = Validity check fail in AP481 VARIABLE DEFINITION NET SELECTION PG A INDEX NUMBER.
Logic 0 = Validity check OK.
Comment: Defines one of two PG index numbers to which net selection variable definition words apply. The two PGs shall be among those defined by AP152.[SS/ICS App A V1 53723]

Field PG A STARTING NET NUMBER (SNNA)

Ref.: SS-JC-10002 3.2.1.1.1.8.6.2.e
Type: Unsigned integer
Values: Logic 1 = Validity check fail in AP488 PG A STARTING NET NUMBER.
Logic 0 = Validity check OK.
Comments: First net number in the sequence of nets for PG A, with which CVLLs will be associated. The starting net number plus the number of channels must not exceed 127.

Field PG A NUMBER OF CHANNELS (NCA)

Ref.: SS-JC-10002 3.2.1.1.1.8.6.2.e.1
Type: Unsigned integer
Values: Logic 1 = Validity check fail in AP487 PG A NUMBER OF CHANNELS
Logic 0 = Validity check OK.
Comments: Number of nets in the block for PG A, with which CVLLs may be associated. Net numbers must be contiguous, but not all nets must have an associated CVLL.

Field VARIABLE DEFINITION NET SELECTION PG B INDEX NUMBER (PGB IN)

Ref.: SS-JC-10002 3.2.1.1.1.8.6.2.e.1
Type: Unsigned integer
Values: Logic 1 = Validity check fail in AP482 VARIABLE DEFINITION NET SELECTION PG B INDEX NUMBER.
Logic 0 = Validity check OK.
Comment: Defines one of two PG index numbers to which net selection variable definition words apply. The two PGs shall be among those defined by AP152.[SS/ICS App A V1 53741]

Appendix A

Field PG B STARTING NET NUMBER (SNNB)

Ref.: SS-JC-10002 3.2.1.1.1.8.6.2.e
Type: Unsigned integer
Values: Logic 1 = Validity check fail in AP490 PG B STARTING NET NUMBER.
Logic 0 = Validity check OK.
Comments: First net number in the sequence of nets for PG B, with which CVLLs will be associated. The starting net number plus the number of channels must not exceed 127.

Field PG B NUMBER OF CHANNELS (NCB)

Ref.: SS-JC-10002 3.2.1.1.1.8.6.2.e.1
Type: Unsigned integer
Values: Logic 1 = Validity check fail in AP489 PG B NUMBER OF CHANNELS
Logic 0 = Validity check OK.
Comments: Number of nets in the block for PG B, with which CVLLs may be associated. Net numbers must be contiguous, but not all nets must have an associated CVLL.

Field TRANSMISSION RATE (TR #x)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP167 TRANSMISSION RATE.
Logic 0 = Validity check OK.
Comments: Each bit indicates the validity check status of the corresponding AP167 TRANSMISSION RATE of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field PG NUMBER #x (PG NS #x)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP152 PG NUMBER.
Logic 0 = Validity check OK.
Comments: Each bit indicates the validity check status of the corresponding AP152 PG NUMBER of the Current Initialization Data File received in the last initialization data load (see section 4.2.2).

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field PPLI FOR TRANSMISSION (PPLI #x)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP168 PPLI FOR TRANSMISSION.
Logic 0 = Validity check OK.
Comments: Each bit indicates the validity check status of the corresponding AP168 PPLI FOR TRANSMISSION of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field ALTERNATE NET ENTRY SLOT (ANES)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP174 ALTERNATE NET ENTRY SLOT.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the corresponding AP174 ALTERNATE NET ENTRY SLOT of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field L/SL FILTER ENABLE/DISABLE (L/SL F)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP177 L/SL FILTER ENABLE/DISABLE.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP177 L/SL FILTER ENABLE/DISABLE of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field CONNECTIVITY MONITORING PERIOD INITIAL OFFSET SET (CMP IOS)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP359 CONNECTIVITY MONITORING PERIOD INITIAL OFFSET SET.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP359 CONNECTIVITY MONITORING PERIOD INITIAL OFFSET SET of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field CONMODE

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP357 Connectivity Monitoring Type (CONMODE).
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP357 CONMODE of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field NET NUMBER (NN)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP364 NET NUMBER.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP364 NET NUMBER of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field PG INDEX NUMBER (PG IN)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in AP365 PG INDEX NUMBER.
Logic 0 = Validity check OK.
Comments: Indicates the validity check status of the AP365 PG INDEX NUMBER of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field NEEDLINE DATA BLOCK #x (NDB #x)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f
Type: Boolean
Values: Logic 1 = Validity check fail in Needline Data Block.
Logic 0 = Validity check OK.
Comments: Each bit indicates the validity check status of the Needline Data Block #x of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

Field TIME SLOT ASSIGNMENT #x (TSA #x) (Blocks 65-384)

Ref.: SS-JC-10002 3.2.1.1.1.19.2.f

Type: Boolean

Values: Logic 1 = Validity check fail in TSA Block.
Logic 0 = Validity check OK.

Comments: Each bit indicates the validity check status of the Time Slot Assignment Block #x of the Current Initialization Data File received in the last initialization data load (see A.4.2.2).

A.5.3.17.3 Stored set number (word #1021) and stored set initialization data load status words 1-37 (words #1022-1058), words 39-58 (words #1060-1079)

All the bits defined in these words are cleared during Terminal start-up (see A.4.2.1) and set appropriately upon completion of validity checking (see A.4.2.3).

Type: Unsigned Integer
Range: 0 to FFFF
Comments: Hex value of the revision number for the software loadable components.

A.5.3.20 Cryptovisible Status Words (words #1128 - 1143)

The Terminal will provide two bit-map arrays, for the reporting of cryptovisible status. These words will indicate if a crypto variable associated with a CVLL (if referenced by AP038, AP088, AP089, AP105, AP106, AP129, valid AP492) is valid and present for the current and/or next crypto periods. The Link 16 waveform will set the indication to “not present” if the CVLL is referenced in either AP038, AP088, AP089, AP105, AP106, AP129, or valid AP492 and the key is not present. If the key is present or the CVLL is not referenced in the any of APs listed above the field will indicate a “no statement”.

Field CVLL Current Crypto Period (Rxxx)

Words#1128-1135 Bits#15-0

Ref.: SS-JC-10002 3.2.1.1.1.13.1

Type: Boolean

Values: Logic 1 = Crypto variable not present
Logic 0 = No Statement

Comments: Indicates status of cryptovariables for the current crypto period, independent of crypto period length.

Field Data Valid Current Crypto Period (DVC)

Word#1128 Bit#0

Ref.: SS-JC-10002 3.2.1.1.1.13.1

Type: Boolean

Values: Logic 1 = Data is valid
Logic 0 = Data is not valid

Comments: Indicates if the cryptovariable status in this block (words 1128-1135) is valid.

Field CVLL Next Crypto Period (Rxxx)

Words#1136-1143 Bits#15-0

Ref.: SS-JC-10002 3.2.1.1.1.13.1

Type: Boolean

Values: Logic 1 = Crypto variable not present
Logic 0 = No Statement

Comments: Indicates status of cryptovariables for the next crypto period, independent of crypto period length.

Field Valid Next Crypto Period (DVN)

Word#1136 Bit#0

Ref.: SS-JC-10002 3.2.1.1.1.13.1

Type: Boolean

Values: Logic 1 = Data is valid
Logic 0 = Data is not valid

Comments: Indicates if the cryptovariable status in this block (words 1136-1143) is valid.

A.5.3.21.1 Time words 1 & 2 (words #1175-1176)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word	Time Word 1															
1175																
1176	Spare										Time Word 2					

Time Words 1 & 2

Ref.: SS-JC-10001 3.2.5.7

Type: Unsigned Integer

Range: 0 to $2^{22}-1$

Comments: The Time Words implement a 22 bit counter which provides the time, in seconds, since the Terminal was turned on. Time Word 1 is the Least Significant Part and Time Word 2 is the Most Significant Part. The Core will reset this word at Start-up, except during recovery from a power interruption.

A.5.3.21.2 RT LRU ETI words (words #1179-1180)

RT LRU ELAPSED TIME WORD (Word#1179)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																

UNCLASSIFIED

1179	RT LRU ELAPSED TIME WORD
------	--------------------------

Ref.: SS-JC-10001 3.2.5.2
 Type: Unsigned Integer
 Range: 0 to $2^{16}-1$
 Comments: Bits 15-0 represent the Elapsed Time for the RT LRU. The LSB corresponds to 12 minutes. The maximum time is 13,107 Hours, which is equivalent to $(2^{16}-1) \times 12\text{min} / 60\text{min/hr}$. When the time rolls over from 13,107 hours to 0, the RT LRU ETI Overflow Counter is incremented.

RT LRU OVERFLOW COUNTER (Word#1180)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word	SPARE														RT LRU ETI OVERFLOW COUNTER	
1180																

Ref.: SS-JC-10001 3.2.5.2
 Type: Unsigned Integer
 Range: 0 to 2^3-1
 Comments: This field is incremented each time the contents of the RT LRU ELAPSED TIME WORD rolls over from 13,107 hours to 0 hours.

A.5.3.21.3 ETI blocks (words #1181-1290)

The ETI blocks will consist of the 10 words provided in the table below.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
I	Part Number Word 1															
II	Part Number Word 2															
III	Part Number Word 3															
IV	Part Number Word 4															
V	Dash Number / Part Number Word 5															
VI	Serial Number (LSB)															

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VII	Serial Number (MSB)															
VIII	Manufacturer Cage Code Word 1															
IX	Manufacturer Cage Code Word 2															
X	Manufacturer Cage Code Word 3															

A.5.3.21.3.1 Part number words (words #1181-1185, words #1191-1195 ... words #1291-1295)

The manufacturer part numbers, associated with the LRUs and SRUs listed in section A.5.3.21 titled ETI words, consist of 10 ASCII characters with the PNC10 character in the table below as the most significant character. All part numbers shorter than 10 characters will pad the most significant characters with the SPACE (“ ”) ASCII character. The following table provides the part number format. Bracketed bit indices [MSB:LSB] represent the range of bits included in the binary representation of ASCII characters that are split across word boundaries.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
I	PNC 3[0:1]		PNC 2						PNC 1							
II	PNC 5[0:3]				PNC 4						PNC 3[2:6]					
III	PNC 7[0:5]						PNC 6						PNC 5[4:6]			
IV	PNC 10[0]	PNC 9						PNC 8								PNC 7[6]

To illustrate how part numbers are stored in status data words, part number P600A242 is processed below. The following table provides the maps the part number to part number characters:

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Word																	
I	“2”[1:0]		“4”						“2”								
II	“0”[3:0]				“A”						“2”[6:2]						
III	“6”[5:0]						“0”						“0”[6:4]				
IV	“ ”[0]	“ ”						“P”						“6”[6]			
	Dash Number										“ ”[6:1]						

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

The binary representation of these ASCII characters is packaged in status data words as follows:

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
I	1	0	0	1	1	0	1	0	0	0	1	1	0	0	1	0
II	0	0	0	0	1	0	0	0	0	0	1	0	1	1	0	0
III	1	1	0	0	0	0	0	1	1	0	0	0	0	0	1	1
IV	0	0	1	0	0	0	0	0	1	0	1	0	0	0	0	0
Dash Number											0	1	0	0	0	0

Part Number Character (PNC) x (x is 1 to 10)

Ref.: SS-JC-10001 3.2.5.2

Type: ASCII

Values: Alphanumeric (0-9, A-Z, a-z)

Comments: The ASCII characters conform to standard ISO 14962:1997. Refer to the Dash Number word for the six MSBs of Part Number Word 5.

A.5.3.21.3.2 Dash number (word #1185, word # 1195 ... word # 1295)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word	Dash Number											PNC 10[1:6]				

Dash Number

Ref.: SS-JC-10001 3.2.5.2

Type: Unsigned Integer

Range: 1 to 1023

Comments: An unsigned integer indicating the configuration status of the SRU. A value of 0 is illegal.

A.5.3.21.3.3 Serial number (words #1186-1187, words #1196-1197 ... words #1296-1297)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
	Serial Number (LSB)															
	Serial Number (MSB)															

A-648

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Serial Number

Ref.: SS-JC-10001 3.2.5.2
Type: Unsigned Integer
Range: 1 to $2^{32}-1$
Comments: An unsigned integer indicating the configuration serial number of the SRU. A value of 0 is illegal.

A.5.3.21.3.4 Manufacturer cage code (words #1188-1190, words #1198-1200 ... words #1208-1210)

The manufacturer cage code, associated with the LRUs and SRUs listed in section A.5.3.21 titled ETI words, consist of 5 ASCII characters, with the MC3 5 character in the table below as the most significant character. The following table provides the manufacturer cage code format. Bracketed bit indices [MSB:LSB] represent the range of bits included in the binary representation of ASCII characters that are split across word boundaries. Refer to the Part Number section above for an example demonstrating the bit mapping.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
I	MC3 3[0:1]		MC3 2						MC3 1							
II	MC3 5[0:3]				MC3 4						MC3 3[2:6]					
III	SPARE												MC3 5[4:6]			

Manufacturer Cage Code Character (MC3) x (x is 1 to 5)

Ref.: SS-JC-10001 3.2.5.7
Type: ASCII
Values: Alphanumeric (0-9, A-Z, a-z)
Comments: The ASCII characters conform to standard ISO 14962:1997.

A.5.3.22 Voice group A and voice group B PGs received/loopback messages (words #1309-1310)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
1309	TOTAL ERASURE COUNT								SP*	RES	SP*	NUMBER OF ERRORS				

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
1310	RESERVED					SPARE				RCV ANT		RES	MESG TYPE (MSB)			

Comments: These two status words contain the data from the most recent received/loopback message in the Voice Group A PG (12) or Voice Group B PG (13).

Field NUMBER OF ERRORS

Word# 1309 Bits# 0-3

Type: Unsigned Integer

Range: 0 to 8

Comments: Specifies the number of corrected block errors for the header block. Only valid if the message is not discarded due to number of block errors and erasures.

Field TOTAL ERASURE COUNT

Word# 1309 Bits# 7-15

Type: Unsigned Integer

Range: 0 to 372

Comments: This field specifies the total number of erasures for all the message blocks. It does not include the header.

Field MESSAGE TYPE (MESG TYPE)

Word# 1310 Bits# 0-3

Type: Coded

Values:

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
0000	Standard FT Uncoded
0001	Packed 2 DP-FT Uncoded
0010	Packed 2 DP-FT Coded OR RTT Interrogation Type A
0011	Packed 2 SP- FF Coded Non-relay
0100	Standard FF Coded Relay Non-relay
0101	Packed 2 DP-FF Coded Non-relay
0110	Standard FT Coded
0111	Packed 4 SP-FF Coded Non-relay
1000	Packed 2 SP FT Uncoded
1001	Packed 4 SP-FT Uncoded
1010	Packed 4 SP-FT Coded OR RTT Interrogation Type B
1011	Packed 2 SP-FF Coded Relay
1100	Standard FF Coded Relay
1101	Packed 2 DP-FF Coded Relay
1110	Packed 2 SP-FT Coded
1111	Packed 4 SP-FF Coded Relay

Comments: This field specifies the type of message provided.

Field RCV_ANTENNA (RCV ANT)

Word# 1310 Bits# 5-6

Type: Coded

Values:

A-651

FOR OFFICIAL USE ONLY
UNCLASSIFIED

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
0	Single Antenna
1	Message received on Antenna A
2	Message received on Antenna B
3	Not Defined

Comments: Identifies the antenna on which the message was received.

A.5.3.23 TACAN output data status (words #1311-1323)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Word																	
1311	BINARY RANGE															RV

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
1323	SIGN	0	BEARING RATE												BRV	

Note: The TACAN Output Data Status words are available only for platforms A and I.

Field BINARY RANGE VALID (RV)

Word#1311 Bit#0

Type: Boolean

Values: Logic 1 = Valid

Logic 0 = Not Valid

Comments: This field indicates if the Binary Range is valid.

Field BINARY RANGE

Word#1311 Bits#1-15

Type: Unsigned Integer

Range/Units: 0.0 to 409.5875 NMi

LSB = 0.0125 NMi

Comments: This field returns the binary RANGE value.

Field RANGE RATE VALID (RRV)

Word#1312 Bit#0

Type: Boolean

Values: Logic 1 = Valid

Logic 0 = Not Valid

Comments: This field indicates if the Range Rate is valid.

Field RANGE RATE

Word#1312 Bits#1-13

Type: Two's complements

Range/Units: -4096 to 4095 Knot (LSB = 1 Knot)

Comments: This field returns the Range rate to beacon.

Field BAM BEARING VALID (BV)

Word#1313 Bit#0

Type: Boolean

Values: Logic 1 = Valid

Logic 0 = Not Valid

Comments: This field indicates if the BAM Bearing is valid.

A-653

FOR OFFICIAL USE ONLY
UNCLASSIFIED

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field BAM BEARING

Word#1313 Bits#1-14

Type: BAM
Range/Units: $LSB = 180/2^{13}$
Comments: This field returns the BEARING in BAMs.

Field ANTENNA SELECTED (ANT)

Word#1313 Bit#15

Type: Boolean
Values: Logic 1 = Antenna A
Logic 0 = Antenna B
Comments: This field indicates which antenna is being used.

Field BINARY CHANNEL NUMBER

Word#1314 Bits#0-6

Type: Unsigned Integer
Range: 0 to 127
Comments: This field returns the TACAN Channel Number selected.

Field BINARY CHANNEL VALID (CH VAL)

Word#1314 Bit#7

Type: Boolean
Values: Logic 1 = Channel Valid
Logic 0 = Channel Not Valid
Comments: This field specifies the validity of the BINARY CHANNEL NUMBER field (word#3 bits#0-6).

Field X OR Y MODE (X/Y)

Word#1314 Bit#8

Type: Coded
Values:

Value	Meaning
0	Y Mode
1	X Mode

Comments: This field returns the X/Y TACAN Mode selected.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field TRANSMIT OR RECEIVE MODE (T/R)

Word#1314 Bit#9

Type: Coded

Values:

Value	Meaning
0	Receive Only
1	Transmit & Receive

Comments: This field returns the Transmit or Receive Mode selected.

Field AA OR GA MODE (A/G)

Word#1314 Bit#10

Type: Coded

Values:

Value	Meaning
0	Ground-to-Air
1	Air-to-Air

Comments: This field returns the AA or GA Mode selected.

Field POWER TEST MODE (PWR TEST)

Word#1314 Bits#12-13

Type: Coded

Values:

Value	Meaning
0	TACAN not initialized
1	Reserved
2	Normal Operation/Test Off
3	Complete Test

Comments: This field returns the POWER TEST command sent. The value 0 means that the TACAN Waveform is still performing the Startup test. The value 2 means that the TACAN command was Normal Operation, so the TACAN test mode is off and the TACAN is working. No test is performed. The value 3 means that the TACAN mode was Logic Test Only or Complete Test, so the TACAN mode test is on and the TACAN test is running the partial or complete test.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field ANTENNA PORT SELECT

Word#1314 Bits#14-15

Type: Coded

Values:

Value	Meaning
0	Auto Antenna Select
1	Auto Antenna Select
2	Antenna B Select
3	Antenna A Select

Comments: This field returns the ANTENNA PORT SELECT command sent.

Field BINARY AGC

Word#1315 Bits#0-6

Type: Unsigned Integer

Range/Units: -93 dBm to 0dBm, LSB = -1 dBm

Comments: This field returns the Automatic Gain Control that is currently being applied to the input TACAN signal.

Field AGC SEARCH OR TRACK (AGC S/T)

Word#1315 Bit#7

Type: Coded

Values:

Value	Meaning
0	Track
1	Search

Comments: This field indicates if the Automatic Gain Control is in search or track mode.

Field BEARING FLYWHEEL (B FLY)

Word#1315 Bits#8

Type: Boolean

Values: Logic 1 = Flywheel active
Logic 0 = Flywheel not active

Comments: This field indicates if the bearing solution is being flywheeled.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field BEARING 135HZ (135 HZ)

Word#1315 Bit#9

Type: Boolean
Values: Logic 1 = Available
Logic 0 = Not Available
Comments: This field indicates if a 135 Hz envelope signal is available.

Field BEARING 15HZ (15 HZ)

Word#1315 Bit#10

Type: Boolean
Values: Logic 1 = Available
Logic 0 = Not available
Comments: This field indicates if bearing processing has detected the presence of a 15 Hz envelope signal.

Field BEARING SEARCH OR TRACK (B S/T)

Word#1315 Bit#11

Type: Coded
Values:

Value	Meaning
0	Track
1	Search

Comments: This field indicates bearing search or track mode.

Field DME FLYWHEEL (DME FLY)

Word#1315 Bit#14

Type: Boolean
Values: Logic 1 = Flywheel active
Logic 0 = Flywheel not active
Comments: This field indicates if the Distance Measuring Equipment solution is being flywheeled.

Field DME SEARCH OR TRACK (DME S/T)

Word#1315 Bit#15

Type: Coded
Values:

Value	Meaning
0	Track

A-657

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
1	Search

Comments: This field indicates if the DME is in search or track mode.

Field VSWRB FAIL (VSWRB)

Word#1316 Bit#0

Type: Boolean

Values: Logic 1 = Failed
Logic 0 = Passed

Comments: This field indicates a VSWRB failure.

Field VSWRA FAIL (VSWRA)

Word#1316 Bit#1

Type: Boolean

Values: Logic 1 = Failed
Logic 0 = Passed

Comments: This field indicates a VSWRA failure.

Field ETI FAIL (ETI)

Word#1316 Bit#2

Type: Boolean

Values: Logic 1 = Failed
Logic 0 = Passed

Comments: This field indicates an Elapsed Time Indicator EEPROM failure.

Field PAPWRS FAIL (PAPWRS)

Word#1316 Bit#3

Type: Boolean

Values: Logic 1 = Failed
Logic 0 = Passed

Comments: This field indicates a PA Power Soft (PAPWRS) failure.

Field PAPWRH FAIL (PAPWRH)

Word#1316 Bit#4

Type: Boolean

Values: Logic 1 = Failed
Logic 0 = Passed

Comments: This field indicates a PA Power Hard (PAPWRH) failure.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field EXPWR FAIL (EX PWR)

Word#1316 Bit#5

Type: Boolean
Values: Logic 1 = Failed
Logic 0 = Passed
Comments: This field indicates an Exciter Power (EXPWR) failure.

Field PALB FAIL (PALB)

Word#1316 Bit#6

Type: Boolean
Values: Logic 1 = Failed
Logic 0 = Passed
Comments: This field indicates a PALB failure.

Field AGC FAIL (AGC)

Word#1316 Bit#7

Type: Boolean
Values: Logic 1 = Failed
Logic 0 = Passed
Comments: This field indicates an AGC failure.

Field RCVR FAIL (RCVR)

Word#1316 Bit#8

Type: Boolean
Values: Logic 1 = Failed
Logic 0 = Passed
Comments: This field indicates a receiver (RCVR) failure.

Field RXSYN FAIL (RXSYN)

Word#1316 Bit#9

Type: Boolean
Values: Logic 1 = Failed
Logic 0 = Passed
Comments: This field indicates a Receiver Synthesizer (RXSYN) failure.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field TXSYN FAIL (TXSYN)

Word#1316 Bit#10

Type: Boolean
Values: Logic 1 = Failed
Logic 0 = Passed
Comments: This field indicates a Transmit Synthesizer (TXSYN) failure.

Field TPSD FAIL (TPSD)

Word#1316 Bit#11

Type: Boolean
Values: Logic 1 = Failed
Logic 0 = Passed
Comments: This field indicates a TACAN Processor's Support Device (TPSD) failure.

Field RAM FAIL (RAM)

Word#1316 Bit#12

Type: Boolean
Values: Logic 1 = Failed
Logic 0 = Passed
Comments: This field indicates a RAM or DMA failure.

Field EEPROM FAIL (ROM)

Word#1316 Bit#13

Type: Boolean
Values: Logic 1 = Failed
Logic 0 = Passed
Comments: This field indicates an Electrically Erasable Programmable Read Only Memory (ROM) checksum failure.

Field CENTRAL PROCESSING UNIT (CPU) FAIL (CPU)

Word#1316 Bit#14

Type: Boolean
Values: Logic 1 = Failed
Logic 0 = Passed
Comments: This field indicates a CPU failure.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field BIT DATA VALID (BDV)

Word#1316 Bit#15

Type: Boolean
Values: Logic 1 = Valid
Logic 0 = Not valid
Comments: This field indicates if the BIT data is valid.

Field BEACON ID CHARACTER #1

Word#1317 Bits#0-5

Type: Coded
Values:

Value	Meaning
0-9	Characters '0' to '9'
10-35	Characters 'A' to 'Z'
36	Character '_'
37-63	Spare

Comments: This field returns the first character of the BEACON IDENTIFIER.

Field BEACON ID CHARACTER #2

Word#1317 Bits#6-11

Type: Coded
Values:

Value	Meaning
0-9	Characters '0' to '9'
10-35	Characters 'A' to 'Z'
36	Character '_'
37-63	Spare

Comments: This field returns the second character of the BEACON IDENTIFIER.

Field BEACON ID VALID 1 (BIV1)

Word#1317 Bit#12

Type: Boolean
Values: Logic 1 = Valid
Logic 0 = Not Valid
Comments: This field indicates if Beacon ID Characters 1 and 2 are valid.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field VIDBIT FAIL (VIDBIT)

Word#1317 Bit#13

Type: Boolean
Values: Logic 1 = Failed
Logic 0 = Passed
Comments: This field indicates a VIDBIT failure.

Field TCRINT FAIL (TCRINT)

Word#1317 Bit#14

Type: Boolean
Values: Logic 1 = Failed
Logic 0 = Passed
Comments: This field indicates a TCRINT failure.

Field EXT FAIL (EXT)

Word#1317 Bit#15

Type: Boolean
Values: Logic 1 = Failed
Logic 0 = Passed
Comments: This field indicates an EXT failure.

Field BEACON ID CHARACTER #3

Word#1318 Bits#0-5

Type: Coded
Values:

Value	Meaning
0-9	Characters '0' to '9'
10-35	Characters 'A' to 'Z'
36	Character '_'
37-63	Spare

Comments: This field returns the third character of the BEACON IDENTIFIER.

Field BEACON ID CHARACTER #4

Word#1318 Bits#6-11

Type: Coded
Values:

Value	Meaning
0-9	Characters '0' to '9'

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Value	Meaning
10-35	Characters 'A' to 'Z'
36	Character '_'
37-63	Spare

Comments: This field returns the fourth character of the BEACON IDENTIFIER.

Field BEACON ID VALID 2 (BIV2)

Word#1318 Bit#12

Type: Boolean

Values: Logic 1 = Valid
Logic 0 = Not Valid

Comments: This field indicates if Beacon ID Characters 3 and 4 are valid.

Field REFDET FAIL (REFDET)

Word#1318 Bit#13

Type: Boolean

Values: Logic 1 = Failed
Logic 0 = Passed

Comments: This field indicates a REFDET failure.

Field RFB FAIL (RFB)

Word#1318 Bit#14

Type: Boolean

Values: Logic 1 = Failed
Logic 0 = Passed

Comments: This field indicates a RFB failure.

Field RFA FAIL (RFA)

Word#1318 Bit#15

Type: Boolean

Values: Logic 1 = Failed
Logic 0 = Passed

Comments: This field indicates a RFA failure.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field DASH NUMBER

Word#1319 Bits#0-9

Type: Unsigned Integer
Range: 0 to 1023
Comments: An unsigned integer indicating the configuration status of the TACAN/BCP SRU.
A value of 0 is illegal.

Field SERIAL NUMBER

Word#1320-1321 Bits#0-15

Type: Unsigned Integer
Range: 0 to $2^{32}-1$
Comments: An unsigned integer indicating the configuration serial number of the
TACAN/BCP SRU. A value of 0 is illegal.

Field BEARING RATE VALID (BRV)

Word#1323 Bit#0

Type: Boolean
Values: Logic 1 = Valid
Logic 0 = Not Valid
Comments: This field indicates if the bearing rate is valid.

Field BEARING RATE

Word#1323 Bits#1-13

Type: Two's Complement
Range/Units: -81.92 to 81.91 degrees/second
LSB = 0.01 degrees/second
Comments: This field returns the rate of change of the bearing.
This field must be concatenated with the field SIGN in word 12, bit 15 (this bit
placed as most significant bit) to form a 14 bits two's complement value.

Field SIGN

Word#1323 Bit#15

Type: Boolean
Values: Logic 1 = Negative value
Logic 0 = Positive value
Comments: See bearing rate field upper

Comments: This field contains a code identifying the specific failure being reported.

A.5.3.26 Reserved

A.5.3.27 EMC protection status (words #2056-5055)

The data contained in these 16-bit word segments of the status file is output to the host by means of Init & Status Data FOM: FOM04 in response to Init & Status Data Request FIM: FIM02.

The EMC Protection Status words contain 1500 status blocks numbered 0 to 1499. Block #0 shall contain the most recent status. Status of increasing age shall be in increasing numbered blocks. When the status blocks are full, the oldest status record shall be deleted.

Each EMC Protection Status block is composed of two 16-bit words as defined below. It records data in accordance with SS-JC-10002 3.2.1.1.1.22.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Word																
2	EMC FAULT				TERM/ HPA	HOURS				MINUTES						

Field DAY OF YEAR (ONES DIGIT)

Ref.: SS-JC-10002 section 3.2.1.1.1.22
 Type: Unsigned Integer
 Range: 0 to 9
 Default: 0
 Comments: This field is set to one on January 1. The beginning of the next day is the beginning of the next day as indicated by the Link 16 network time. In a leap year, 31 December is day 366. This field is set to zero when the status words for a record have no valid data. It is set to zero when a record is cleared.

Field DAY OF YEAR (TENS DIGIT)

Ref.: SS-JC-10002 section 3.2.1.1.1.22
 Type: Unsigned Integer
 Range: 0 to 9
 Default: 0
 Comments: This field is set to zero on January 1. The beginning of the next day is the beginning of the day as indicated by the Link 16 network time. In a leap year, 31 December is day 366. This field is set to zero when the status words for a record have no valid data. It is set to zero when a record is cleared.

Field DAY OF YEAR (HUNDREDS DIGIT)

Ref.: SS-JC-10002 section 3.2.1.1.1.22
 Type: Unsigned Integer
 Range: 0 to 3
 Default: 0
 Comments: This field is set to zero on January 1. The beginning of the next day is the beginning of the day as indicated by the Link 16 network time. In a leap year, 31 December is day 366. This field is set to zero when the status words for a record have no valid data. It is set to zero when a record is cleared.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field BEGIN/END TIME INDICATOR

Ref.: SS-JC-10002 section 3.2.1.1.1.22

Type: Coded

Values:

Value	Meaning
0	No statement
1	Beginning Time Indicated
2	Ending Time Indicated
3	Not used

Default: 0

Comments: This field specifies whether the time indicated is the beginning or ending time of the activity given in the BEGIN/END ACTIVITY field. It is set to No statement when an EMC fault is reported.

a. The beginning of an “exercise/combat mode” period is considered any of the following:

1. When Link 16 is in a “load complete” state and an initialization data change is received changing the EMC protection mode adaptable parameter (AP006) to “exercise/combat.”
2. At startup, the Link 16 Waveform Application uses the Current Use Set which contains the EMC protection mode adaptable parameter (AP006) set to “exercise/combat.”
3. Upon completing the validity checking of an initialization load in which the newly created Current Use Set contains the EMC protection mode adaptable parameter (AP006) set to “exercise/combat.”

b. The end of an “exercise/combat mode” period is considered any of the following:

1. When Link 16 is in a “load complete” state and an initialization data change is received changing the EMC protection mode adaptable parameter (AP006) from “exercise/combat” to any other mode.
2. When a “teardown” event is received and the Terminal is currently initialized with the EMC protection mode adaptable parameter (AP006) set to “exercise/combat.”
3. Upon receiving an initialization restart command.

c. The beginning of a “high power enabled” period is considered any of the following:

1. When Link 16 is in a “load complete” state and an initialization data change is accepted that results in the JTR having the ability to transmit at a power level exceeding 200 watts when prior to the change the ability did not exist.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

2. At startup, the Link 16 Waveform application uses the Current Use Set which contains initialization data that results in the JTR having the ability to transmit at a power level exceeding 200 watts.
3. Upon completing the validity checking of an initialization load in which the newly created Current Use Set contains initialization data that results in the JTR having the ability to transmit at a power level exceeding 200 watts.

The requirements in this sub-section apply when the output power mode adaptable parameter (AP011) is set to “high power (HPA).” They also apply if the output power mode adaptable parameter (AP011) is set to “mixed power” and then the power select adaptable parameter (AP137) is set to “high power (HPA).”

- d. The end of a “high power enabled” period is considered any of the following:
 1. When Link 16 is in a “load complete” state and an initialization data change is accepted that results in the JTR not having the ability to transmit at a power level exceeding 200 watts when prior to the change the ability did exist.
 2. When a “teardown” event is received and the JTR is currently initialized with the ability to transmit at a power level exceeding 200 watts.
 3. Upon receiving an initialization restart command.
- e. The beginning of a transmission inhibit occurs when Link 16 is in a “load complete” state, the EMC protection mode is full or exercise and (1) the EMC protection feature (EPF) fault count is incremented to two or is two or more at instantiation, or (2) there is failure of start-up or manually initiated BIT, whichever was more recently performed.
- f. The end of transmission inhibit occurs (1) Link 16 is changed from instantiated to uninstantiated and there is a transmission inhibit, upon successful start-up or manually initiated built-in test and transmission inhibit is solely the result of failed start-up or manually initiated BIT. End of transmission inhibit also occurs if after an IPF reset two or more messages are transmitted without a resulting transmission inhibit. End of transmission inhibit shall not be recorded solely based on the IPF reset being activated.

Field BEGIN/END ACTIVITY

Ref.: SS-JC-10002 section 3.2.1.1.1.22

Type: Coded

Values:

Value	Meaning
0	No Statement
1	Exercise EMC Protection Mode
2	Combat EMC Protection Mode
3	High Power Enabled
4	Transmit Inhibit
5-7	Not Used

A-673

FOR OFFICIAL USE ONLY
UNCLASSIFIED

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Default: 0
Comments: This field indicates the activity to which the beginning and ending time applies. It is set to no statement when an EMC fault is reported.

Field MULTIPLE/SINGLE TIME SLOT FAULTS (M/S)

Ref.: SS-JC-10002 section 3.2.1.1.1.22
Type: Boolean
Values: Logic 1 = Fault is one of multiple faults in a time slot.
Logic 0 = No other fault in the same time slot.
Default: 0
Comments: This field is set to logic = 1 if the fault reported is one of multiple faults that occurred in the time slot. It is set to logic = 0 if the fault reported is the only fault that occurred in the time slot.

Field MINUTES

Ref.: SS-JC-10002 section 3.2.1.1.1.22
Type: Unsigned Integer
Range: 0 to 59
Default: 0
Comments: Time of day minutes referenced to Link 16 network time.

Field HOURS

Ref.: SS-JC-10002 section 3.2.1.1.1.22
Type: Unsigned Integer
Range: 0 to 24
Default: 0
Comments: Time of day hours referenced to Link 16 network time.

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Field TERMINAL/HPA

Ref.: SS-JC-10002 section 3.2.1.1.1.22
Type: Boolean
Values: Logic 1 = High Power Amplifier
Logic 0 = Terminal
Default: 0
Comments: When a transmission inhibit is reported, this bit shall indicate whether transmission through the HPA or Terminal antenna ports is inhibited. If the Terminal is initialized to transmit through the RFA, this bit will identify the inhibit as RFA (Logic 0) and if the Terminal is initialized to transmit through the HPA this bit will identify the inhibit as HPA (Logic 1).
When an EMC fault is reported, this field indicates the source of the fault.

Field EMC FAULT

Ref.: SS-JC-10002 section 3.2.1.1.1.22
Type: Coded
Values:

Value	Meaning
0	No EMC Fault
1	Capability to Transmit EPF Fault
2	Pulse Width EPF Fault
3	1030/1090 MHz Low Level EPF Fault
4	Short Term Histogram EPF Fault
5	Long Term Histogram EPF Fault
6	Out-Of-Band EPF Fault
7	1030/1090 MHz High Level EPF Fault
8	Reserved
9	Reserved
10	Overpower EPF Fault
11	Uniform Use Of Authorized Carriers OBIT Failure
12	1030/1090 Low Level SBIT/IBIT Failure
13	Pulse Width SBIT/IBIT Failure
14	Overpower OBIT Failure
15	CTT Isolator SBIT/IBIT Failure

UNCLASSIFIED
FOR OFFICIAL USE ONLY
ICS-JC-10002 Rev -
Appendix A

Default: 0

Comments: The field is set to value from 1 to 15 upon occurrence of the fault. Otherwise it is set to 0. If more than one type of fault occurs in a time slot then, each is reported in successive status blocks. A status block shall be generated for each fault detected while in the full, exercise and combat EMC protection modes. There is an exception when operating in the combat EMC protection mode. If the same EPF fault occurs in the prior three transmit time slots and the current time slot, the fault in the current time slot shall not be recorded. Independent of the EMC Features mode selected, if the capability to transmit EPF fault occurs in the prior three time slots and the current time slot, these being either transmit or receive time slots in any combination, the fault in the current time slot shall not be recorded. The assumption is that the fault is persistent. In the combat EMC protection mode transmission is not inhibited and therefore when the fault is persistent an EPF fault report is generated in each transmit time slot. If the above rule is not followed, a separate record would be generated for each transmit time slot. The 1500 records could be filled in a short time.

When operating with a JTIDS Class 2H Terminal HPA, the Capability to Transmit, Uniform use of Authorized Carrier BIT, Output Power BIT and CTT Isolator BIT are not applicable. When operating with an HPA that has capability to transmit monitors and the HPA performs only Link 16 transmission, then CTT isolator BIT is not applicable because power to HPA transmitter stages is removed when HPA transmission is inhibited and at least one HPA fault is a capability to transmit fault.
